DEC boosts reliance on channel partners

By Jaikumar Vijayan

Internal roiling at Digital Equipment Corp. over how best to deal with customers is about to spark another overhaul of its sales force. However, the company is sending mixed signals about whether the news will be good or bad for large customers.

One thing is clear: Digital's channel partners will start to play a bigger role. How this will affect direct accounts is unclear, but analysts and some users predict that some large customers will lose direct account status while smaller companies will gain a more direct flow of information from assigned Digital representatives.

DEC, page 16

What Digital's business reorganization means for some of its biggest customers:

- Increased channel role in new system purchases, order processing, system configuration and installation
- More customers will be assigned specific sales representatives
- Lower cost of sales and distribution
- Larger channel presence

Users snubbing router firewalls

By Bob Wallace

Internetworking vendors are starting to tackle security issues in earnest by offering router firewall options designed to keep hackers from breaking in to enterprise networks. But users aren't exactly applauding.

Weak protection

Analysts say most routers have only rudimentary firewall capabilities.

Last week's much-ballyhooed introductions by Ascend Communications, Inc. and Bay Networks, Inc. raise more issues than they address, according to analysts. The products are just the beginning of a trend, they said.

Firewalls are software gateways, usually running on dedicated computers or routers, that sit between the Internet and the corporate network. They can be programmed to block intrusions by hackers through remote sites.

Visual Basic, Java vie for 'net crown

By Sharon Gaudin and Frank Hayes

Microsoft Corp. is winding up for an early knockout in the Internet ring. Its game plan is to get developers to substitute Visual Basic for Sun Microsystems, Inc.'s Java language.

The key is that Visual Basic has a much bigger user base than Java, according to Judith Hurwitz, president of Hurwitz Group, Inc. in Newton, Mass. "If Microsoft can take Visual Basic and make it viable for the Internet ... then the potential [is there] that people will say, 'Gee, we already know this. We don't have to retrain and spend a lot of money,'" she said. "[Microsoft] could win."

But Java's biggest supporters — Sun, IBM and Netscape Communications Corp. — won't go down without a fight.

"It's a 'Visual Basic everywhere' strategy," Visual Basic, Java, page 109

Notebook advances spark heated debate

By Mindy Blodgett and Melissa Bane

For one corporate road warrior, faster isn't necessarily better when it comes to notebooks.

"The president of my company complains that his [133-MHz] Compaq notebook gets only 45 minutes of battery life," said Douglas Moran, information systems analyst at CRSS Constructors, Inc. in Denver. "He has started telling me he misses his 486. With the 486, he used to make it almost all the way across the country on just one battery."

Moran's boss isn't alone.

"Faster, lighter, smaller" has been the mantra in the notebook industry and is the driving force behind new releases. But users must trade the advantages of lighter-than-air desktop replacement notebooks for shorter battery life and overheated components, including PC cards.

"Heat dissipation is always a challenge in a laptop," said Dan Coolidge, an attorney at Sheehan, Phinney, Bass & Green in Manchester, N.H. "But for users like me, the issue is reliability and battery life. It's up to the notebook makers to

Switch makers try price cuts

By Bob Wallace

Switch vendors Network Equipment Technologies, Inc. (NET) and Madge Networks, Inc. are looking to break price barriers that will enable users to save big bucks when they build enterprise networks.

NET, based in Redwood City, Calif., last week announced new capabilities for its Integrated Digital Network Exchange (IDNX) switch that lower the cost of building frame-relay networks from \$1,600 per port to roughly \$500 per port. Madge, in San Jose, Calif., unveiled its Visage Ethernet LAN switch, which costs less than \$190 per port.

NET officials said they hope the move will help close the market share gap between it and StrataCom, Inc. In the meantime, Madge's first low-end Ethernet switch will battle 3Com Corp., Cabletron Systems, Inc. and Cisco Systems, Inc.

Exciting news

One longtime NET user said she was excited about the IDNX components, which are shipping now. "They'll help us expand our private frame-relay network much more easily and far less expensively than we could have before," said Deborah Philippe, vice president of client/server computing and telecommunications at the Federated Systems Group, the networking unit of Cincinnati-based Federated Department Stores, Inc. The company already runs a 450-site frame-relay network with NET IDNX switches.

StrataCom's IPX switches are more expensive, up to \$700 per port, but StrataCom officials said they are working to lower that price.

The private frame-relay switch market shows steady and healthy growth, doubling in size from roughly \$155.6 million last year to an estimated \$332.1 million in 1998, according to Vertical Systems Group, Inc., a consulting and research firm in Dedham, Mass.

But Madge faces an uphill battle because it isn't a market power in low-end Ethernet switching.

"It's great that Madge has extended its Ethernet switch line down into the desktop switching market, but they've got to take on the likes of 3Com, which is no easy task," said Tam Dell'Oro, president of the Dell'Oro Group, a market research firm in Menlo Park, Calif.

The \$190-per-port price includes 24 switched Ethernet ports, two Fast Ethernet uplinks and network management.

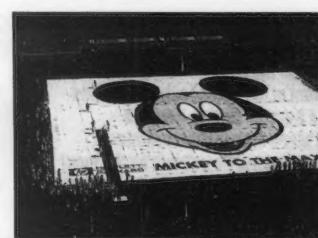

Token Ring users go with Ethernet switching. See page 55.

Tired of scooping kitty litter? This computerized LitterMaid from Comtrax Industries in Midlothian, Va., has an electric eye that senses when your cat exits the box. Then the microprocessor starts an automatic sifter that deposits waste in a sealed container. The LitterMaid costs \$199.

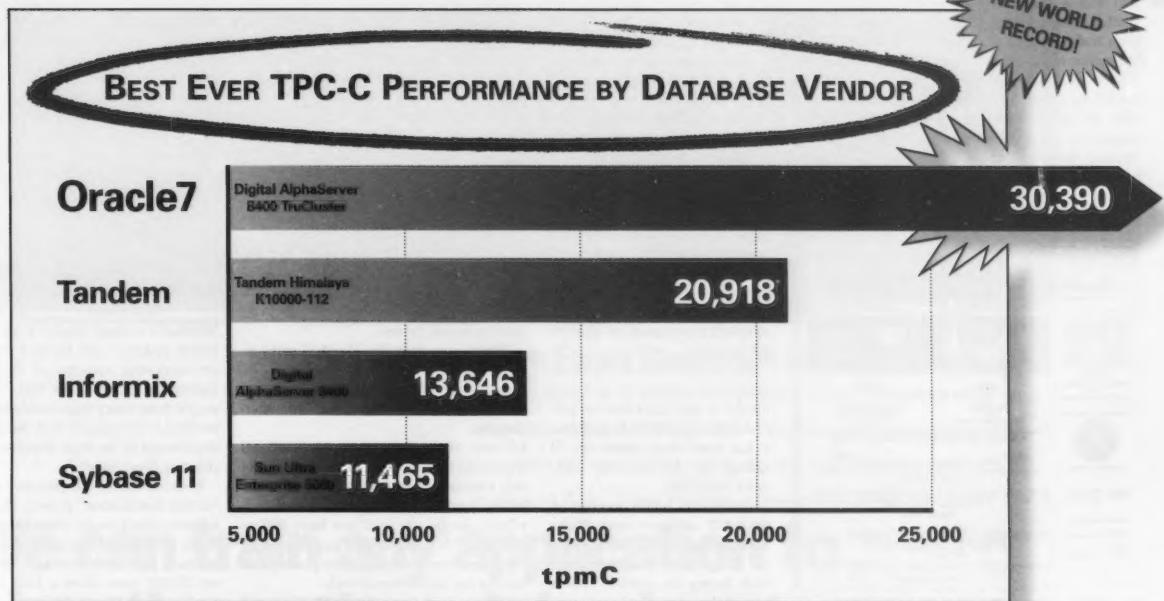

ISymbol Technologies in Bohemia, N.Y., released a wearable bar-code scanner in 1992 that gave new meaning to the concept of point and shoot. This is the next generation, which is less bulky and frees users' hands. The RS-1 Ring Scanner fits on a user's forefinger and is activated by a button on the side. At 1.7 ounces, it may be the world's smallest laser scanner. It connects to a variety of portable computing devices, such as Symbol's WS-1000 wrist computer.

Hewlett-Packard has taken publicity stunts to new lengths. HP recently got 700 Los Angeles-area schoolchildren, parents and teachers to assemble more than 2,000 puzzle pieces to create what may be the world's largest computer-generated puzzle. The 27,000-sq.-ft. puzzle was assembled in about two hours. The interlocking pieces were printed by HP color printers. The stunt required 42,000 feet of recycled paper.

Oracle7 Parallel Server: Safe at any Speed

Oracle7 Parallel Server™ breaks Tandem's TPC-C world record! The TPC-C benchmark is the industry standard test for measuring database On-Line Transaction Processing (OLTP) performance.

"Oracle has a superb solution for enterprise-class OLTP. They have literally achieved results we only dreamed of a few years ago." —Peter Kastner, Vice President, Aberdeen Group

Oracle Parallel Server enables multiple computers to simultaneously access the same database. Multiple computers working together means you get record breaking performance, and there is no single point of failure in the system. If one of those computers should fail—your application continues to run on the other machine(s). If you love speed but don't want to crash, call us at 1-800-633-1071, ext. 8130 or find us on the Web at <http://www.oracle.com>. If crashing at low speed seems OK, call Informix or Sybase. They just haven't been able to make multiple computers work together yet.

Distributor uses news to sell Web ads

By Robert L. Scheier

Online "zines" fade almost as fast as they appear on the World Wide Web, but look who's selling advertising on their own Web site: a 1.2 billion electronics distributor.

Marshall Industries in El Monte, Calif., is able to sell those ads because it splices up the parts lists and specification sheets on its site with vendor news, live audio feeds from trade shows and online interactive seminars.

Late last month, Marshall beefed up its online strategy with an intranet that gives customers and suppliers customized views of Marshall's products, services and inventory, said Pres-

Marshall Industries'
Barbara Allen says every
company team contributed to building the
Web site

the paid advertisement.

It is too early to tell how much business the Web sites could bring in, Robles said, but "there's a great synergistic energy between us and Marshall. They're providing real-time information to customers," making the top of the page, it says "Philips Semiconductors" in

It pays to advertise

"The ads enable us to get mind share," said Emilio Robles, a spokesman at Philips Semiconductors in Sunnyvale, Calif., which has been advertising on the site for about a month. "When people search on 'microcontrollers,' it comes back with our microcontrollers and our competition's microcontrollers. But on the top of the page, it says 'Philips Semiconductors'" in

the paid advertisement.

It is too early to tell how much business the Web sites could bring in, Robles said, but "there's a great synergistic energy between us and Marshall. They're providing real-time information to customers," making the top of the page, it says "Philips Semiconductors" in

the paid advertisement.

Rodin said he doesn't try to calculate the number of new customers or new sales the site generates, but he said he is confident it has more than repaid the \$1 million in development costs since early 1994.

One recent online seminar attracted 87 engineers from about a dozen countries, he said. Three or four ordered development tools during the session. That is something that rarely happens during a traditional seminar at a

Marshall Industries' Web site beefs up parts listings with news about vendors and interactive seminars

cards, encryption technology and a secure operating system that lets users build military-class security into their World Wide Web servers, company officials said.

FedEx Corp. is one customer listening closely to HP's pitch. The promised security technology could help FedEx offer Internet-based shipping and billing services on a wider scale than is feasible now, said Robert B. Carter, vice president of corporate systems development at the Memphis-based package delivery giant.

"Today, we basically have it controlled so that you have to be a registered user to make use of [the Internet applications]," Carter said. "We would love to be able to open that up so that

anybody with a credit card could ship with us, and we could make sure that it was a legitimate transaction."

HP plans to bring out the following products this year, starting late in the third quarter:

- An operating system/Web gateway combo that doesn't give root users any control, thus blocking a common method used to take over systems. The Virtual Vault product, which is based on custom software acquired earlier in the year, will initially support HP-UX and will later become available for Microsoft Corp.'s Windows NT.
- Smart cards with personal ID numbers that companies could use to limit access to encrypted data or applications on intranets or the Internet. Next year, HP plans to add cards with a built-in compact database, which Informix Software, Inc. is developing, that could store multiple functions such as encryption keys and employee benefits information.

- Portable cryptography technology and a related product, code-named Sugar, that will let systems administrators use encryption keys to prevent end users from

From megabytes to sound bites

s Rob Rodin the president and CEO of a parts distributor or of a news network for the electronic industry?

He makes it sound like both. He calls Marshall's online information offerings the Electronic News and Entertainment Network.

Last week, those offerings included audio reports from the Design Automation Conference in Las Vegas, complete with keynotes from Netscape Communications Corp. Chairman Jim Clark and Sun Microsystems, Inc. Chief Technical Officer Eric Schmidt, as well as an interactive seminar on Extended Data Output dynamic RAM.

Marshall is also beefing up its information offerings for its own customers and suppliers. Its PartnerNet offering, announced last month, creates a personalized profile for customers who can ac-

cess Marshall's intranet.

Software distributors such as Stream International, Inc. in Westwood, Mass., have long offered newsletters commenting on industry trends and technology to help build demand among customers. Marshall has aggressively extended this strategy to the Web, spending \$325,000 on a sophisticated audio studio to host its online seminars and hiring a former radio announcer to produce live reports from trade shows.

Such information helps create a better environment for advertisers. They can buy space on the site's home page or on other pages within the site or buy "key word" locations where the advertiser's logo will appear when a user searches for certain words, says Internet marketing manager Barbara Allen.

— Robert L. Scheier

hotel ballroom, he said.

Key lessons from the Marshall story include the following:

- Make your Web site an integral part of your business strategy, not an afterthought.
- Create the site with cross-functional teams that include representation from not only information systems but also the marketing, legal and even warehouse staff.
- Don't do the site until you have a clear goal for it. At Marshall, its goal was to let customers learn about and buy products 24 hours a day, seven days a week.

The site went live in July 1994, the result of more than a year of work to help achieve

Marshall's strategic goal of a "virtual distribution system," said Barbara Allen, Internet marketing manager at the company. During the process, she said, "we've had people from every team inside of Marshall involved." This ranged from the accounting department to the legal department to the shipping department.

Because the Web is just part of a larger "virtual distribution" system, the Web developers didn't create a stand-alone site. Instead, they perform nightly downloads of product, price and availability information on 170,000 parts from a DB2 mainframe database to an Oracle database accessed by the Web server.

FedEx's Robert B. Carter
says company has to be

loading potentially damaging applets written in Java, Sun Microsystems, Inc.'s development language for the Internet.

FedEx, which just signed a global purchasing deal for HP products and services, is looking "very strongly" at Virtual Vault as a way to open up Internet access to the public while preventing unauthorized users from breaking into customer accounts and other sensitive data, Carter said.

Sugar also sounds potentially useful as Java applets become more widespread, he added.

& HP debuts its 64-bit chips. See page 44.

HP plays catch-up with debut of Internet security products

By Craig Stedman

Belatedly trying to make its mark on the Internet, Hewlett-Packard Co. in the next few months will start announcing a series of security products aimed at making the online world safer for business uses.

HP admittedly let server rivals such as Sun Microsystems, Inc. and Silicon Graphics, Inc. steal most of the early thunder as the Internet market took off. Now, HP executives want to catch up by tapping into corporate concerns about Internet and intranet security threats.

In a series of announcements starting in the third quarter, HP will unveil smart

cards, encryption technology and a secure operating system that lets users build military-class security into their World Wide Web servers, company officials said.

FedEx Corp. is one customer listening closely to HP's pitch. The promised security technology could help FedEx offer Internet-based shipping and billing services on a wider scale than is feasible now, said Robert B. Carter, vice president of corporate systems development at the Memphis-based package delivery giant.

"Today, we basically have it controlled so that you have to be a registered user to make use of [the Internet applications]," Carter said. "We would love to be able to open that up so that

Micro Focus Challenge 2000 Program

As challenging as it seems, it's a problem that's only going to get more dangerous with time. Today, 20% of business applications cannot handle dates after the turn of the century. By the year 2000 that number will increase to 90%.* Those that aren't converted will fail. The Micro Focus

We can train any application to obey the century date change.

Challenge 2000 Program gives you a comprehensive program of tools and services to fully assess

and implement the century date change. Start with the Application Express Offloader™ tool to automatically move the application to a PC. Use Micro Focus' Revolve® Year 2000 analysis tools to inexpensively locate the problem areas. Then, modify the application with Micro Focus COBOL Workbench. You can even choose to replace your date logic with TransCentury® Calendar Routines. It's quick. It's efficient. It's complete. It's also an effective first step towards reengineering your legacy COBOL applications.

After all, fixing a business application should be as quick and painless as possible (right Fido?).

See for yourself.

Call 1-800-MFCOBOL today for your free Assessment Tool Kit.

It provides a complete set of guidelines for structuring your Year 2000 project.

IBM, Digital boost object-based apps

By Craig Stedman

IBM and Digital Equipment Corp. are racing each other to marry messaging middleware to object request brokers (ORBs), a technology union that users and analysts said should make it much more practical to build large-scale applications based on distributed objects.

Linking the two technologies will let ORBs take advantage of the store-and-forward communications approach used by messaging middleware. That approach doesn't require a live connection between systems to send requests for data — or in this case, objects — back and forth.

By comparison, the remote procedure calls typically used by ORBs mandate that a direct connection be established and kept alive until a response is received. That simply isn't flexible enough for object-based applications spread across numerous servers, said Charles Nettles, director of technology at McKesson Corp.'s Information Technologies division in San Francisco.

"We could never guarantee equipment at both ends of a transaction being up and running at the same time," Nettles said. "On the scale that we'll be dealing with eventually, I just don't have that luxury."

McKesson, a pharmaceuticals

distributor, uses IBM's MQSeries middleware and is keenly interested in the promised linkage with its System Object Model (SOM) request broker, Nettles said. The combo would be particularly useful for a new object-based decision-support system that McKesson will market to external customers such as hospitals and pharmacies, he said.

Tying an ORB to asynchronous middleware that provides guaran-

What's this all about?

Key middleware and object technologies

MESSAGING MIDDLEWARE:

Software that lets applications exchange data via asynchronous connections and store-and-forward queues

OBJECT REQUEST BROKER:

Software that manages and routes communications between client and server objects on a network

REMOTE PROCEDURE CALL:

Synchronous protocol that transmits requests from clients to servers over live connections and waits for responses

teed message delivery is also important for running object-based applications over intranets and the Internet, Nettles added. "I can't think of a more asynchronous environment than that."

Products such as MQSeries and Digital's DECmessageQ let applications proceed with other tasks while waiting for responses to requests for data from different servers. ORBs need that capability to avoid getting bogged down in vicious send-and-wait cycles, observers said.

"With object-oriented applications, you may have several requests going out at the same time, and you certainly don't want to get all tied up waiting for the replies," said Karen Boucher, an analyst at The Standish Group International, Inc. in Dennis, Mass.

Bridging bridges

IBM late last month made a prototype tool kit version of a bridge between MQSeries and SOM available for downloading from its World Wide Web page. The bridge is scheduled to be packaged with a new SOM 3.0 release due out this fall, said Anthony Brown, IBM's manager of object technologies marketing.

MQSeries executives at IBM said they plan later to link the middleware with rival ORBs, such as Iona Technologies Ltd.'s Orbix.

Digital is developing a similar bridge between DECmessageQ and its ObjectBroker software, confirmed Dan Gilfix, business and product manager for the ORB. Gilfix said the bridge will be ready "in the near future," but he wouldn't be more specific.

Concord streamlines early-warning system

By Patrick Dryden

Administrators who reach for Network Health reports with their morning coffee can now scan one-page bulletins on performance anomalies instead of wading through a pile of reports to find problems.

That is one of many requested capabilities that Concord Communications, Inc. included in its major upgrade to Network Health, available this week. The software helps managers automate the monitoring and analysis of network performance.

Version 2.5, which starts at \$9,995, streamlines the early-warning function that managers need to prevent problems before they cause failures and require frantic troubleshooting.

In a nutshell

The customizable Exception Reports provide detailed views of network anomalies and relevant statistics, distilled from pages of reports.

"With text and trend charts combined on one page, we quickly see all the information we need without requiring other reports," said beta tester T. X. Ho, a senior communications engineer at

Chevron Information Technology Co. in San Ramon, Calif.

Beta tester Debby Briggs, a wide-area network consultant at Healthsource, Inc. in Hooksett, N.H., tracks daily utilization of WAN connections and then prints an Exception Report at 5 a.m.

"I've been harping on them to break down reports to show just what is most important to me so I can find and deal with performance issues quickly," said Patrick Brennan, a network operations manager at Mercer Management Consulting, Inc. in New York.

Users are pleased that Concord ported Network Health to

run on HP-UX workstations from Hewlett-Packard Co., instead of only SPARCstations from Sun Microsystems, Inc.

Brennan said this lets him "migrate to a bigger box" in his HP shop when he needs more power.

That enables a single view of very large networks without the overhead of constant management traffic.

No other tool offers the automation and report flexibility found in Network Health, said Jim Metzler, consulting services director at Strategic Networks Consulting, Inc. in Rockland, Mass.

News Shorts

GM drives with Compaq

General Motors Corp. has given Compaq Computer Corp. the largest server order in the computer vendor's history. Under the contract, Houston-based Compaq will supply 8,500 ProSignia 300 servers that run Windows NT to GM dealers across the U.S. The servers are part of an effort to improve communications and information exchange between GM headquarters and its dealer network. The project will begin in September.

CSC outsources maintenance

Sometimes, even a services firm needs services. Last week, Computer Sciences Corp. outsourced maintenance of its desktop-to-mainframe computers to Amdahl Corp. under a five-year, \$150 million contract. Under the contract, Amdahl will support more than 450 distributed computing sites and mainframe data centers in North America and Asia.

CA licenses GUI technology

Computer Associates International,

Inc. announced it has licensed graphical user interface (GUI) technology for AS/400 applications from Client/Server Technology, Inc. in Atlanta, CA said it plans this month to release beta versions of two business management applications, CA-PRMS and CA-Warehouse Boss, that will include new GUIs.

Micro Focus loses \$13M

Micro Focus said last week it lost more than \$13 million in its first fiscal quarter, ended April 30. The Cobol compiler ven-

dor, whose U.S. operations are in Palo Alto, Calif., said \$8 million of the loss was a restructuring charge for shutting down facilities and laying off about 65 people, roughly 8% of its 700-person workforce. Revenue for the quarter was \$24.2 million, down from \$28.7 million a year ago.

Baan aims for big projects

Baan Co. has tailored its Unix-based Baan IV software for the large projects industry. Users and analysts said the Unix-based software package could significantly reduce lead times and cut costs for manufacturers of complex, engineered-to-order products, such as a one-of-a-kind turbine or cargo ship. Baan's mega-projects software, now available, costs between \$4,000 and \$6,000 per concurrent user.

Tool vendors to merge

Pure Software, Inc. and Atria Software, Inc. said they will merge by the end of September. Pure Software in Sunnyvale, Calif.,

makes tools for testing newly developed applications. It will pay about \$970 million in stock for Lexington, Mass.-based Atria, which makes products for managing the development process. The new company, Pure Atria Corp., will be based in Sunnyvale and will keep Pure Software's Reed Hastings as its CEO, the companies said.

Apple tussles with IRS

Apple Computer, Inc. and the Internal Revenue Service are tangling once again. The IRS claims that Apple owes back taxes in excess of \$140 million for 1988 through 1991. Apple disputes the claims — which center around systems sold in the U.S. but made in Ireland — and has filed suit. The two are set to go to court next April if they can't reach an agreement. Just last fall, Apple settled an even bigger dispute with the IRS that could have resulted in Apple paying more than \$1 billion.

SHORT TAKE Under a restructuring program at Mobil Corp., Michael P. Ramage was named operating officer at the Fairfax, Va., firm's technology group.

It not only runs all
the leading CAD/CAM/CAE applications,
it also excels at games.

The RS/6000 Workstation When you're designing an event that brings the world together, you need a workstation that's equal to the challenge. For the 1996 Olympic Games in Atlanta, that meant using a proven champion: the RISC System/6000® workstation.

From designing athletic venues to selecting camera angles to creating a dynamic 3-D tour of the stadium, RS/6000™ workstations helped engineers and architects plan many aspects of the Games.

It's what you'd expect from a family of workstations that's

skilled at running all the leading design software: CATIA/CADAM, Pro/ENGINEER, Unigraphics, CADD5, I-DEAS Master Series and Euclid 3. And it's why more than 10,000 athletes and a global audience of billions will experience the Games like never before.

For a closer look at how the RS/6000 can handle your biggest design challenges, get our free guide, "What to look for in a Workstation." Call 1 800 IBM-3333, ext. FA225, or drop by www.rs6000.ibm.com on the Net.

And enjoy the Games.

Microsoft designs keys for 'net security

Features to be embedded in Web browser, NT

By Gary H. Anthes and Laura DiDio

Microsoft Corp. last week announced a comprehensive framework for secure Internet use, including electronic commerce.

The new features will appear later this year in Microsoft products such as the Explorer World Wide Web browser. The features eventually will be embedded in the Windows and Windows NT operating sys-

tems. They combine public key cryptography and password technologies.

The framework, some elements of which have been announced in the past few months, builds on Windows security features but will adhere to Internet standards. Microsoft officials said the framework will

be interoperable with other vendors' products, such as Netscape Communications Corp.'s Web browser.

Steve Sommer, vice president of MIS at Hughes Hubbard & Reed, a New York law firm, called the framework a "one-stop shop for Internet security." He said he is especially pleased that the initiative builds security into the Windows NT environment.

"If I'm using the Internet, I don't want to think about security, and I also don't want to stand the added time and expense of buying and testing various security add-ons," Sommer said. "Microsoft's Internet Security Framework will help alleviate that problem."

"If I'm using the Internet, I don't want to think about security, and I also don't want to stand the added time and expense of buying and testing various security add-ons."

— Steve Sommer, vice president of MIS, Hughes Hubbard & Reed

In public key cryptography, each user has a public and a private encryption key. The sender of a message uses the recipient's public key to encrypt a message, and the recipient uses his private key to decode it. This also can be used to create tamper-proof digital signatures that authenticate users and ensure message integrity.

Secure traffic

The Microsoft Internet Security Framework includes several previously announced components. For example, it includes code-signing, which allows software to be distributed securely over the Internet, and the Secure Electronic Transaction protocol for credit-card use on the Internet.

At the foundation of the Microsoft framework are cryptographic application programming interfaces. The firm announced CryptoAPI 2.0, which extends the functions in the CryptoAPI 1.0 that now ships in the Internet Explorer 3.0 beta and Windows NT 4.0 beta. The new release supports certificate-based authentication, certificate management and digital signatures.

A certificate is a digital document that proves that a person who presents a public key owns that key. The certificate is trusted because it is digitally signed by a trusted party called a certification authority.

Other components include the following:

- Certificate Server, which sits on top of CryptoAPI and issues and manages certificates under user-specified policies.
- Digital Wallet, which holds a user's passwords, credit-card numbers, certificates, private keys and other vital data for electronic commerce. The contents of the wallet are encrypted; in this way, the contents can be safely stored. Digital Wallet will appear in Internet Explorer Web browser later this year and eventually will be integrated with Windows.

How Forté Became The Fastest Growing Systems Software Company In History

With all the shouting and outrageous claims being made about systems development tools, we thought you might like to cut through the confusion over application development breakthroughs. Simply put, we *really* have one, and our success speaks for itself.

The breakthrough: application partitioning. You develop as if for one machine, and the Forté Application Environment™ seamlessly, automatically and dynamically distributes your application objects across however many servers and for however many clients, irrespective of platform, operating system or RDBMS. Period.

If you need to develop, deploy and manage high-end client/server applications, we invite you to spend half a day at the next Forté seminar. Call 800-90FORTE (800-903-6783). Or reserve your seat via the Web.

SAP AG dresses up R/3 for retail customers

By Julia King

SAP AG is preparing to crack the multibillion-dollar worldwide retailing market with a major new version of its R/3 enterprise software, *Computerworld* has learned.

The Disney Store and Nash Finch Co., a food wholesaler with 115 stores, are due to receive the package by year's end. General availability of SAP Retail is scheduled for early next year.

Nash Finch is in the early stages of looking at the software, said Patty Dill, the company's director of future systems.

So far, the software's strong areas include financials, order management and sales and distribution, she said. "But we won't use their warehouse system because we need a more sophisticated system and will use a third party," Dill said.

Tough to tell

Analysts regard SAP's move into the highly volatile and quirky world of retail as dicey. R/3, which has its roots in manufacturing, is a tightly integrated system that is hostile to on-the-fly configuration changes.

Retailers, by contrast, operate in a fast-paced world of "blue light" specials and one-day sales.

"Retailing is an entirely different business. Once you establish processes with manufacturing, you don't have to change much. But each retailer has different processes that are very customer-driven," said Tom Friedman, editor of "Retail Systems Alert," a newsletter in Newton, Mass.

Systems performance is another concern with client/server systems in general. Some retailers

Home Depot CIO Ron Griffin: You'd have to put a turbocharger on [R/3] to handle our transaction volume'

worry that R/3 would buckle under the weight of thousands of transactions a day.

"We looked at SAP, and some of our concerns were around performance," said Ron Griffin, chief information officer at \$16 billion Home Depot, Inc. in Atlanta.

"We have 30,000 customers a week in 445 stores and will add another 450 stores over the next four years. You'd have to put a turbocharger on [R/3] to handle our transaction volume," he said.

But John Nelson, director of SAP's retail center of expertise in Chicago, said a team of 80 retail experts — as opposed to software developers — has been working on these issues since 1994, when

SAP acquired Dacoss, a German retail consultancy.

The group has developed, among other things, more than 300 retail-specific business processes, which will be part of SAP Retail. These include the ability to funnel point-of-sale data from stores directly into an R/3 enterprise system.

SAP also has been stress-testing R/3's overall system performance in conjunction with Metro AG, a \$43 billion European retail and wholesale empire, which processes its financial transactions under R/3.

"I'd challenge anyone to find higher volumes than Metro's," Nelson said.

IS managers place high value on online services

By Mitch Wagner

While pundits question the future of proprietary online services in the open-standards age of the Internet, information systems managers say online services are valuable venues for building sites that attract consumers.

Proprietary online services have experienced explosive growth in recent years, but some question whether Internet technology will make them obsolete.

"If I develop a site on the Internet, then the number of users I can reach increases substantially," said Brad Meintert, an analyst at Input. "Why should I limit myself to just the customers on one online service?"

Race to the 'net

Indeed, online services are scrambling to embrace the 'net. Last week, CompuServe, Inc. announced plans to license Microsoft Corp.'s Normandy server, a Windows NT software package designed for Internet service providers and online services.

The Columbus, Ohio, online service will use Normandy to migrate content to the Web, with the first significant elements to go live in late fall, said Kevin Knott, vice president of strategic planning and development at CompuServe.

CompuServe also said it will license the Microsoft Explorer World Wide Web browser, and Microsoft will put an icon for CompuServe on the desktop for Windows 95. That will put CompuServe access just a mouse-click away for users. America Online announced a similar browser-

and-icon deal in March.

But CompuServe and AOL are far from irrelevant, information systems managers say. Those services have a broad appeal to consumers that matches, or perhaps exceeds, the Internet.

"Online services such as CompuServe and AOL provide a training ground to people new to the online world," said Catherine Graeber, senior vice president of interactive banking at Bank of America NT & SA. "There is a comfort feeling to the point-and-click environment. We need to be where the consumers are."

Tom Kelly, spokesman for First Chicago NBD Corp. in Chicago, agreed. "There's such a mass of customers that you don't want to give up," he said.

The simple act of setting up an Internet account can be overwhelming for users, said Marvin Chow, interactive marketing manager at Reebok International Ltd.

Reebok has its own Web site and is planning to place offerings on AOL and CompuServe.

Microsoft announces Normandy Internet server

Designed for Internet service providers

Offers dial-up access to functions such as the Web, newsgroups and Internet mail

Automates billing for customers

Runs on Windows NT

Preliminary versions available late this summer; final version available fourth quarter

Quick Poll: Are proprietary online services relevant? See www.computerworld.com.

Sybase joins the text management parade at last

By Dan Richman

Sybase, Inc. on Tuesday will become the last of the three major relational database management systems vendors to say how it will let users manipulate and search text.

Sybase will announce it has licensed TopicSearch, a text-search engine from Verity, Inc. in Mountain View, Calif. The company plans to integrate the engine into the next version of its SQL Server RDBMS, which is slated to enter beta testing this fall, said David

Hsieh, Sybase's vice president of enterprise product marketing.

Rival Informix Software, Inc. recently said it, too, will license TopicSearch. Oracle Corp. is the only vendor already shipping an integrated text-search engine, developed internally.

To many users, text is the most important type of nontraditional data that all RDBMS vendors are racing to deal with in forthcoming versions of their products.

"We already use both TopicSearch and Sybase, but using

them together requires brute force. This will make it streamlined, so users can search for a given word or phrase no matter

which field it's in some database," said Dan Woods, applications editor of Pathfinder, a Web site produced by Time, Inc. New Media in New York.

"Sybase is last with its text management plans, but sometimes it pays to be last," said Brian Kent, CEO of Inspired Arts of San Diego, a Web site management company. "TopicSearch works on lots

of platforms, and with Sybase's middleware, it's a marriage that will be very flexible and powerful."

Users ambivalent?

The drive to handle objects — text, audio, video, Web pages and other data besides numbers and character strings — is the strongest competitive imperative in the database industry today. But vendors may care more than users.

"Object strategy? I'm not sure that has much to do with us," said Sybase user Cecil Jarmer, an information technology manager at

Providence Health System in Portland, Ore. "We're just making the transition from 3GL to 4GL and from character mode to GUI, and it's a slow, hard struggle. We just don't need objects yet."

But for Sybase as a company, objects are critically important. Sybase's reputation for technical prowess has been tarnished by reports of bugs and nonscalability in Version 10 of SQL Server. The company lost \$6.9 million in the quarter ended March 31, and analysts say only strong sales of SQL Server 11 can help.

IBM users clear Windows plan

Multiplatform support seen as inevitable

By April Jacobs
CHICAGO

Call it inevitable, or just call it common sense, but when IBM embraced the Windows and Windows NT platforms last week at Comdex/Spring '96, it was no surprise to its customers or analysts.

IBM, which has long skirted the issue of Windows support, said it will offer the appropriate Windows and Windows NT versions of software in the development, data management and document management arenas. Many releases are scheduled for delivery this month [CW, June 3].

The nitty gritty

Among the specifics IBM laid out were the following:

- In the development area, the company will put VisualAge for Cobol, C++ and Basic on Windows and VisualAge Generator, TeamConnection and its OpenDoc beta version on Windows 95 and Windows NT.
- In the data management area, the company released an enhanced version of its DB2 product for Windows NT and a single-user DB2 for Windows 95. It also added Adstar ADSM Version 2.1 to the list, with support for Windows NT Server, Windows NT and Windows 95.

Operating systems

Its document management products — FlowMark, ImagePlus and Visual Info — will have Windows versions. The three products were originally released for IBM's OS/2 platform.

IBM also will offer its Database Server on Windows NT.

One possible impetus for what may see as a long-overdue move might be IBM's and Lotus Development Corp.'s acquisition of scores of Windows users in the desktop market.

OS/2's traditionally loyal users appear to be unperturbed by IBM's newly aggressive support for the rival Windows and NT.

"It makes sense to me," said James Stuyck, a member and retired leader of the 650-member Dallas/Fort Worth OS/2 Users' Group.

"I'm also a stockholder of IBM, and I can't fault them for releasing software for every platform where they can make money. And just because they're releasing [software] on Windows doesn't mean they're abandoning OS/2 users," he said.

"They have to be cross-platform if they're going to do software," said Richard Miles, manager of technical services and information systems at Prentiss Properties, a commercial real estate firm in Dallas.

business," Miles said. "The reality of it is that I don't get to pick and choose, and I'm going to end up supporting a bit of all of this."

His message to IBM: "Provide me with applications that run across platforms. Let's not have OS/2 be a religious issue."

The right stuff

Joel Diamond, technical director at Wugnet, an online Windows users group, said he sees IBM's move as an attempt to get into the value-added hardware and software market.

Longtime OS/2 supporter William Zachmann, president of Canopus Research in Duxbury, Mass., said the move is purely common sense.

"Obviously, lots of people use Windows. It has dominant share on the desktop, and there is a high level of interest for Windows NT on the server, as well," he said. "If you want to sell software and want to cover the waterfront the way IBM does, Windows is one of the platforms you've got to cover."

As for the OS/2 market, Zachmann said OS/2 isn't going to stand or fall based on whether IBM supplies Windows tools or applications.

"The fact of the matter is, IBM is selling to a broader market, and OS/2 has not gone away," Zachmann said.

& IBM brings Windows to the mainframe. See page 49.

Reaping remote rewards

Mobile workers help bottom line

By April Jacobs

Mobile computing software and hardware might be somewhat expensive, but companies may get their money back if their employees take work home or on the road.

At Comdex/Spring '96 last week in Chicago, Rob Enderle, an analyst at Giga Information Group in Santa Clara, Calif., said companies can expect to pay \$6,100 to \$7,800 more than what a desktop setup would cost over three years to support a mobile professional.

But he said the benefits companies can reap in increased productivity can amount to more than double what it costs to supply laptops vs. desktop PCs.

Enderle presented a survey of information technology professionals about the costs associated with mobile computing. Giga conducted the poll in May.

Enderle's figures take into account the cost of acquiring the laptop and supporting it, which averages about \$100 per month, he said.

"It's soft dollars, so it's hard for the IT organization to measure," he said, because much of what firms will realize is in productivity.

Springtime show comes in like a lamb

The weird and wacky from this year's expo

By Computerworld staff
CHICAGO

Arguably the quietest Comdex/Spring ever, this year's show was rife with vendors that seemed to say, "Wait a couple of weeks until we hit PC Expo. Then we'll show you something."

Of course, the show did offer attendees a wide variety of products, including wireless networking technology, desktop software and a host of strange giveaways.

As they looked through a copy of the Windows World at Comdex/Spring '96 brochure while they ran off to see a demonstration, some users began to discuss

not what excited them, but their frustration with the term "internet." "What does that mean, anyway — a new way to waste time at your desk?" one user asked.

Other users seemed unimpressed with a display of high-speed computing. At its Windows World booth, Digital Equipment Corp. set up three rows of some of its fastest computers to run hands-on demonstrations of products. But the speed appeared to be wasted on the application demonstrations. Many audience members were playing solitaire on the Pentium Pro machines, while the pitchman navigated his way through the demonstration. "Whatever makes

them happy," said a Digital employee watching from nearby.

What didn't make many attendees happy were the lines for taxis, which stretched for what seemed an eternity, and the hour's wait.

But attendees were even less happy about the tour they had to take through a mazelike construction site to reach the trains, which actually seemed to be running on time.

About the best thing on the show floor was foot and shoulder massages from On-site Bodyworks. The going rate was \$12 for 10 minutes and \$20 for 20 minutes.

Oh, and because nothing these days matters unless it is online, On-site Bodyworks has an electronic-mail address, onsite4@aol.com.

Comdex Weirdos Award: To Ifusioncom, which used its booth space to create a display devoted to a giant psychedelic blob called Papilio Internetus Morpho Blos-somus.

Ifusioncom had no one there other than a "security guard" who handed out postcards that contained the company's Internet address, a picture of a newborn about to get introduced to the world and the slogan, "If the Internet is the birth of a new industry, we're the slap on the ass."

Favorite giveaway: Iomega Corp., which passed out buttons that offered clever phrases starting with "I." Among them were "I byte," and "I am the artist formerly known as Prince."

New multimedia notebooks debut. See page 43.

Money well-spent
Is it worth it?

"Absolutely," Enderle said.

If a professional works an extra two hours per week at home or on the road, a company could realize an additional 100 hours of work per year. Based on an average rate of pay for a professional of \$50 per hour, that means about \$5,000 per professional per year in additional work supplied.

According to the Giga survey, mobile workers use their systems an average of 2.8 hours per day when away. And they are away 67 days per year, or an average of 3.75 hours per week.

Enderle said companies that are looking into providing laptops for employees may want to consider sharing the cost of the machines because it reduces the life-cycle cost of the unit, and people are more likely to take care of something they own.

News

PC Expo to highlight Web, mobile trends

By Stewart Deck

Attendees at next week's PC Expo in New York will get their fill of the World Wide Web and applications for mobile users.

While attendance seems to be slipping at some trade shows, PC Expo organizers said they expect the June 17-20 event to

match last year's record-breaking figure of 131,000 visitors and draw the most exhibitors in the show's history.

Web technologies will hog most of the limelight. National Internet Source, Inc., in Ramsey, N.J., will show off

WebFalcon, a new tracking system that blends statistics and information from Web site forms into a database of visitor demographic information.

Maximum Information, Inc., in San Francisco, will preview an enterprise-wide Web management system that helps users publish and maintain thousands of pages of content on multiple sites.

Lotus Development Corp. plans to expound on the Web capabilities of Notes 4.x, especially with Domino, the native Hypertext Transport Protocol Notes server that is in beta testing. The Cambridge, Mass., firm wants to show that Notes can be used as a groupware tool and for Web page management.

Traveling Software, Inc., in Bethel, Wash., will combine both show themes in demonstrating its WebEx product, an Internet application that works with Web browsers to provide off-line Web access.

Fujitsu PC Corp. in Milpitas, Calif., will enter the notebook market with three aggressively priced notebook lines (see photo below).

Pricing for Monte Carlo, Fujitsu's new multi-media notebook PC, starts at \$3,299.

Compaq Computer Corp. plans to introduce Armada, a notebook PC with a slim-line design. Texas Instruments, Inc. will announce an expansion of its notebook line.

Off the show floor, Microsoft Corp. is going to deliver briefings on a forthcoming version of its best-selling Office suite of desktop applications that will add intranet-

specific features and facilities.

For PC server vendors, PC Expo will be a time to show off recently announced Pentium Pro systems designed for Windows NT Server-based applications. Market leaders Compaq, Hewlett-Packard Co. and IBM PC Co. have announced new four-

processor PC servers that will ship shortly after the PC Expo tent folds.

PC vendors will demonstrate the latest version of the Intel Corp. Pentium processor, a 200-MHz chip, in their desktop systems. Vendors will also show an array of Pentium Pro workstations, high-end desk-

tops designed for 32-bit applications.

Now that IBM's noncompete agreement with printer manufacturer Lexmark International, Inc. has expired, IBM will enter the network printer arena by announcing three monochrome printers and one color model.

DEC channels

CONTINUED FROM PAGE 1

tatives. Digital is expected to clear up some of the mystery this week when it formally rolls out a sweeping reorganization plan that may trigger a fresh round of layoffs. The news sent Digital stock tumbling 6% late last week.

Meanwhile, last week, there was plenty of speculation about what Digital will do. A Digital executive and two analysts said the company may reduce the number of directly and wholly served accounts to about 300. That is down from the current 1,000 large customers. This in turn represents a drastic reduction of the 10,000 or so customers Digital directly served two years ago.

An executive from Digital's Internet Business Unit also confirmed that a move toward the indirect channel was under way.

But a second, higher-ranking Digital executive insisted that there was no move to reduce the number of direct accounts.

Channel focus

Harry Copperman, vice president and general manager of Digital's Systems Business Unit, said that as part of the reorganization, the company will, in fact, increase the number of accounts directly covered by a Digital account manager. He said channel partners — such as dealers, value-added resellers and systems integrators — will become much more involved in order fulfillment and coverage.

Joe Polizzi, the vice president of the U.S. chapter of Digital Equipment Computer Users Society, Digital's user group, welcomed the move to assign representatives to more accounts.

"I think it is a wonderful idea to have a representative assigned to act as a sort of information conduit between Digital and these customers," he said.

The part that was really missing for a lot of the smaller and medium-size companies was any kind of reliable information flow from Digital about its products and strategies, Polizzi explained.

But Terry Shannon, editor of "Shannon Knows DEC," a newsletter in Ashland, Mass., said, "Some of the larger accounts that suddenly lose their most-favored status aren't going to be very amused." He said 55% of Digital's sales come through indirect channels. "The overall impact of any such move is likely to be mainly psychological, however. Digital has some pretty capable partner coverage out there," he said.

Senior writer Michael Goldberg contributed to this report.

News

Pentium line tops out at 200 MHz

Intel preps for next generation; will direct corporate users toward 'Pro' family

By Bob Francis

The Pentium is dead. Long live the Pentium.

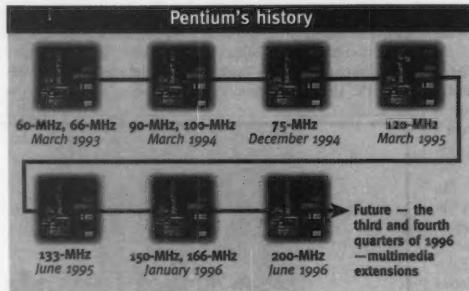

That will be Intel Corp.'s rallying cry this week as it crowns its Pentium line of processors with the 200-MHz version.

The 200-MHz chip is the last of this line of Pentiums. The next generation uses the multimedia extension instruction set and will be aimed primarily at consumer and small-business applications.

New task

Intel and its PC manufacturer groupies are shifting corporate emphasis to the Pentium Pro, which is rapidly dropping in price to attract corporate users.

The price of these Pentium Pros dressed for corporate success starts at just under \$3,000 and is expected to drop below \$2,500 by year's end.

The 200-MHz Pentium will be priced just below current Pentium Pro prices; it will cost less than \$3,000 for a fully outfitted system.

But as this shift from Pentium to Pentium Pro occurs, other important decisions are taking place in the software court — where Microsoft Corp. rules.

The Pentium Pro was designed

for 32-bit applications and awaits the arrival of Windows NT 4.0.

Users are left to wait while this chicken-and-egg situation plays itself out.

"The prices are great on Pentium Pro, but there's no real compelling reason to change over all your systems until we see what we can do with NT on the desktop," said Janet Fowler, an infor-

mation systems consultant at DuPont Co. in Wilmington, Del.

Some PC manufacturers are easing the transition by offering Windows NT 3.51 with a free upgrade to 4.0. Dell Computer Corp. in Austin, Texas, and Hewlett-Packard Co. in Palo Alto, Calif., are making that offer to users.

Others such as Advanced Logic Research, Inc. in Irvine, Calif., are offering step-by-step instructions to help users decide whether to use the Pentium or Pentium Pro.

Still, some systems manufacturers are chomping at the bit, wishing the transition to 32-bit software would come sooner rather than later.

"We're left essentially selling [Pentium Pro] systems for software that isn't there. That's not an easy thing to do," said one product manager at a PC manufacturer who asked not to be identified.

Users snub firewall option for hubs

CONTINUED FROM PAGE 1

Among the shortcomings of these latest firewalls are high costs, lack of interoperability and an inability for them to be used as stand-alone systems at central sites.

For example, although vendors promise users enticing cost reductions by adding firewall software to routers rather than having to buy and manage stand-alone firewall products at central and remote sites, users see things differently.

"Adding things to already-busy switches builds you one gigantic and expensive-to-expand box performing too many tasks."

— Bob Currier,
Duke University

"I'd be creating a single point of failure for my network and inviting major problems by running the software on the router that's already anchoring my enterprise network," said Jim Fay, director of strategic technologies at PMI Mortgage Insurance Co. in San Francisco. "If I had security prob-

lems at remote sites, I'd have to take that router down, which would disrupt my entire network."

Fay isn't alone in his views.

"I want my enterprise switch doing enterprise switching and not extra tasks like running firewall security for the company," said Bob Currier, director of data communications at Duke University in Durham, N.C. "Adding things to already-busy switches builds you one gigantic and expensive-to-expand box performing too many tasks."

And once you've done that, it becomes nearly impossible to take that device off-line for any reason, Currier added. "I'd much rather buy a low-end workstation running stand-alone firewall software and keep that function separate," he said.

While Cisco Systems, Inc. and 3Com Corp. emphasize stand-alone systems at central sites, Ascend and Bay don't.

Less expensive

As for price, Ascend in Alameda, Calif., and Bay in Billerica, Mass., correctly stress that the add-on software approach is cheaper than stand-alone firewalls on workstations, but firewall security is still too costly for the masses.

For example, adding firewall software to Ascend's lowest-end \$1,295 Pipeline 500 remote-office

box will cost users \$500, which may be tough to swallow at small sites, for which the equipment was priced low to begin with.

And at a headquarters site, adding firewall software to Ascend's central-site \$11,000 Max 4002 or \$15,500 Max 4004 box will cost \$4,000.

Firewall security concerns

Addition of firewall software can overburden central site routers

Today's firewalls don't interface with multiple vendors' wares

Functionality varies by vendor

Dearth of firewall functionality in remote access servers

Software options can be expensive

"Anything over 25% of the price you paid for the box is pretty substantial," Fay said.

Ascend, Bay and others are pushing nationwide internetwork security because they acknowledge that it is possible to hack in to their remote gear at small offices and then get through a firewall at a central site.

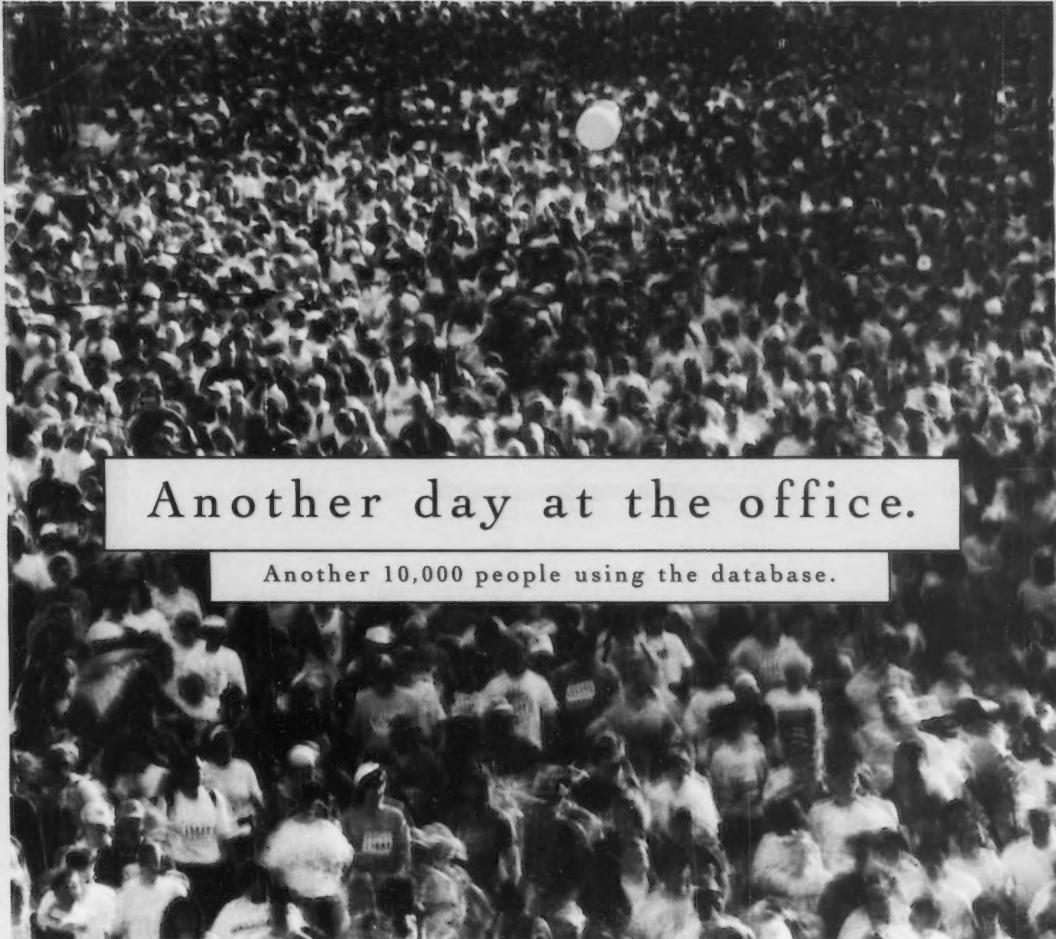

Analysts say hacking goes beyond routers with firewalls.

"If I'm a hacker, I'm going to look at every option to hack in to a network, not just at routers," said Mike Zboray, research director

The lack of firewall interoperability means firms with equipment from multiple vendors are left out in the cold for now. "There's not a lot we can do for them now," said Bernie Schneider, marketing vice president at Ascend.

George Spenser, manager of network operations at Uniphilth America in Mission Hills, Calif., said he is thankful his company is a single-vendor router shop.

"It really makes life a lot easier and means I don't have to fight fires with multiple vendors," he said.

Another day at the office.

Another 10,000 people using the database.

How Sybase® SQL Server™ 11 speeds things up for Household Finance Corporation.

Handling 10,000 users on a database at once is tough. But consider what HFC does for customers on its database—loan applications and credit decisions. Now you're really talking tough. Which is why HFC recently switched to Sybase SQL Server 11. They found it's the only database with the performance to handle this kind of demand—processing 302 transactions a minute with a 1.64-second response time. Hey, if Sybase SQL Server can run HFC's business, it'll make yours look like a walk in the park.

HOW WILL THE LAUNCH OF MID-RANGE COMPUTING? LET'S JUST

The Compaq ProLiant 5000 has arrived. And it's going to change everything that lies in its path. Including how you think about mid-range computing.

The ProLiant 5000, with its Pentium® Pro technology, delivers unprecedented performance for mid-range solutions.

But that's just the first half of the story.

In today's client/server environment, you need

more than power—you need control. So we've combined Pentium Pro technology with a concept we're calling Integration Management. Giving you new tools to manage your system throughout its entire life cycle.

Improvements to SmartStart now let you set up an Integration Server, which basically serves as a holding tank for all your software. It also simplifies the setup and maintenance of your network. All you have to do is configure your Integration Server and then, using SmartStart, deploy it across your entire network. It not only ensures consistency across

all your network servers, it saves you a lot more than just shoe leather.

Maintaining your network is easier now, too. Thanks to some cool new features on Compaq Insight Manager, you can get updates and new software revisions via the Internet, your modem or CD. And then

System	tpmC	\$ per tpmC
ProLiant 5000 6/166 M2	\$676.93	\$135
HP 9000 Server T500	\$621.00	\$380*
WorkMark 5100S	\$607.00	\$394
SPARC center 2000E	\$124.21	\$323
HP 9000 Model K420	\$4939.11	\$232
IBM RS/6000 J30	3631	\$289

*A lot of companies claim to offer the lowest cost of ownership. But we have the benchmarks to prove it.**

transfer them to the Integration Server just one time. You can even maintain your network

when you're away from the office. All you need is your notebook and a phone line.

We've also partnered with the industry-leading companies of system management applications. So now you can view your entire network in one place. Together, these and other improvements have helped reshape the landscape of mid-range computing, by creating the most manageable server in the industry. To find out more about the ProLiant 5000, visit our Web site at www.compaq.com, or call us at 1-800-315-7772. It's not just a server. It's a force to be reckoned with.

Has It Changed Your Life Yet?

IBM adds Internet features to AS/400 upgrade

Operating system allows browser access, incorporates security features

By Michael Goldberg

IBM will give AS/400 users a lift onto the World Wide Web this month with a much-

anticipated operating system release designed to make the popular business computer Internet-friendly.

Version 3, Release 2 of the OS/400 oper-

ating system, available June 21, will make it possible for users to view AS/400 data through any Hypertext Markup Language browser, such as Netscape Communica-

tions Corp.'s Navigator.

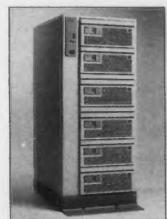

The new OS/400 version will support the Serial Line Internet Protocol connectivity standard and will contain Internet security features for encrypting data and regulating access to AS/400 systems, IBM officials said.

IBM is also expected to add AS/400 support for other Internet standards, such as Point-to-Point Protocol, in the coming year.

Bob Cargill, a systems manager at Oriental Trading Co., said his catalog sales firm has been waiting for Internet capabilities on the AS/400 and that he hopes to use either IBM's technology or an offering from I/Net, Inc. in Kalamazoo, Mich. The company has been using a Windows NT server to support its Web page.

Closer look

"We're looking ... to allow our customers the capability to access order information and possibly enter orders and get order shipping status on the Internet," Cargill said. "Now that the capability has come in-house [on the AS/400], that's why we're really looking at it closely."

IBM reprimed its AS/400 storage subsystems, cutting costs on 2G- and 4G-byte disk arrays to bring them in line with Unix storage. The firm is also making software available to convert AS/400 storage systems to Unix.

Last week's announcement "is a big important step" for AS/400 users, said Dave Andrews, managing partner at D. H. Andrews Group, Inc., a consultancy in Cheshire, Conn.

The AS/400 division has worked quickly to adopt Internet features as part of an obsession" by IBM management with network computing, Andrews said.

At the same time, IBM needs to support even more emerging Internet standards, such as Secure Sockets Layer protocol, to encrypt transactions over the 'net.'

Features galore

In addition to the OS/400 features, IBM plans the following:

- A Notes port to the AS/400, made through the Integrated PC Server, an Intel Corp. processor board inside the system.
- Windows 95 client access, available through a software suite called Client Access/400.
- Increased data warehousing capabilities for the DB2 database on the AS/400.

IBM also introduced a \$750 "open systems conversion kit" for its AS/400 9337 storage subsystems that makes the disk arrays work with either AS/400 or Unix servers. Prices announced last week also bring costs for the 9337 in line with IBM's 7137 disk arrays designed for Unix systems.

The Internet Commerce Expo

September 9-12, 1996, Anaheim Convention Center, Anaheim, California.

Dedicated to the development of internet commerce via the World Wide Web and the growth of the corporate intranet.

Hot Event. Cool Customers.

If you're a corporate decision maker, ICE is your best opportunity to find the productivity enhancing solutions you've been looking for.

Hundreds of leading hardware, software, and network services vendors will be at ICE to show you how to increase productivity and profitability via the latest internet technology.

A special 3-tier conference will provide a full range of hot topics that deal directly with the needs

of developers, IT managers, business managers and senior executives.

And you won't want to miss The Internet Open—an exciting new floor show that will get everyone fired up with the industry's largest-ever on-line demonstration of user applications for the World Wide Web.

If it's hot, it's here.

This is a must-attend show. So mark your calendar now for ICE. And this fall, get where it's hot!

To register and pay on-line: visit our Web site at <http://www.idg.com/ice>.
Or call 1-800-667-4ICE (4423). Or fax 1-508-370-4325.

ON JUNE 11TH.
YOU CAN GET BACK
TO RUNNING
YOUR BUSINESS.

INSTEAD OF
YOUR SOFTWARE.

Tomorrow, J.D. Edwards will announce the multi-platform version of OneWorld,[™] the first ever enterprise-wide business software to deliver the benefits of Configurable Network Computing.[™] The technology behind this remarkable new architecture is designed to mask the complexities that make client/server systems so cumbersome — allowing you to focus on more important matters, like managing your business. Best of all, OneWorld will work with UNIX, Windows NT, OS/400, and MVS, so you can choose the technology that's best for you. And it's available only from J.D. Edwards, a world leader in business management software, with almost 4,000 customers in more than 90 countries. For a free white paper explaining how OneWorld can help you get back to business, call 1-800-727-5333. Or visit us at www.jdedwards.com

Java pitched to wake up management tools

By Patrick Dryden

Hoping to perk up the manageability of enterprise networks, SunSoft, Inc. and more than a dozen other vendors recently pledged to build interoperable tools based on Sun Microsystems, Inc.'s Java program-

ming language and a newly defined management interface.

That means central administrators and remote support staff alike could run applets from any browser-equipped desktop to manage network devices, systems, applications and users over the Internet

or a private intranet.

Efforts to extend management software control through the 'net are limited. Vendors are forced to adapt report functions to the text- and forms-based interface enabled by the World Wide Web or to attempt direct manipulation of management data.

Soon, vendors and in-house developers will be able to turn to the Java Management application programming interface (API) due soon from SunSoft in its Solstice WorkShop tool kit. These functions provide a common ground to create the kind of interactive management that is possible through proprietary management consoles.

"The Java Management API promises a much more cohesive environment, standardized for anyone to build tools," said John McConnell, president of McConnell Consulting, Inc. in Boulder, Colo.

He said he expects late next year to see a critical mass of applets that integrate via the Web "instead of the current balkanized set of split-up applications."

Promoters of the Java Management API include Bay Networks, Inc., 3Com Corp., BMC Software, Inc., Cisco Systems, Inc., Computer Associates International, Inc., Compuware Corp., IBM/Tivoli, Legato Systems, Inc., Novell, Inc. and Platinum Technology, Inc.

"Now vendors of network devices and all kinds of systems are more likely to enable their products to respond to enterprise management systems," said Peter Norwood, director of strategy at the Tivoli Systems, Inc. division of IBM.

Web reporting for some tools that manage the global network for Texas Instruments, Inc. has been helpful. "But this sounds like a step beyond," said Blair Sanders, senior member of the technical staff at TI in Dallas.

"Java applets should enable remote configuration and more dynamic information exchange," Sanders said. "And maybe vendors won't be so far behind in supporting all the different clients we need to access their management servers."

Many vendors already working with the Java Management API are expected to ship applets to support remote interaction with their products in the third quarter, said Brian Biles, marketing director for enterprise network products at SunSoft in Mountain View, Calif. In-house developers can get the Solstice WorkShop tool kit this fall.

Check it out

See a demonstration of the Java management APIs at www.sun.com/solstice/products/workshop.html

The Power Tool of Direct Marketing Card Deck Advertising

Today, direct response card decks are one of the most powerful and cost-effective ways to reach a group of potential buyers. Card decks bundle together product and service offers and are mailed directly to the desks of a highly-qualified target audience. The cards are presented in a postage-paid business reply card format so easy to respond to that they practically demand response!

Computerworld Card Decks are the perfect example of the success you can have generating leads and making sales by using card decks. Just look at what our advertisers have to say:

Cost-Effective

"With their excellent cost-per-lead, Computerworld Card Decks consistently generate the highest profits of any deck we've tried. Every time we advertise we receive well over 100 leads. Sometimes we even get responses six months later."

Mary Cooper
Vice President
cSoftware, Inc.

Sales Success

"Month after month, quality leads and sales success show us that Computerworld Direct Response Cards are one of the most effective ways to reach more of our potential audience - faster and easier."

David Kimball
President
Telepartner International

Quality Leads in Volume

"I used to be a bit skeptical of the potential value of card deck advertising. However, after running my first ad in the Computerworld Card Deck, I quickly discovered that a lot of people do look at card decks. I was shocked by the volume of responses when the first box was delivered, the majority were from professionals with a sincere interest in my product."

Russ Teubner
President
Teubner & Associates

Best Lead Source

"In our multi-level advertising approach, card decks traditionally rank among our best lead sources. In fact, we average upwards to 750 responses for each Computerworld Direct Response Card we run."

Marty Murphy
President
Faulkner Information Services

Computerworld Card Decks give you a cost-effective way to reach Computerworld's powerful buying audience of over 143,000 computer professionals. Every month. They're working for these advertisers - and they can work for you!

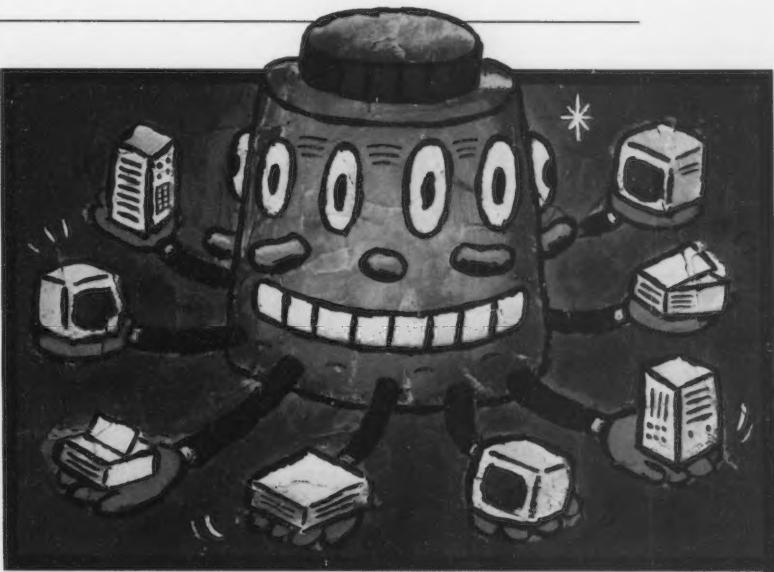

To reserve your space, call Norma Tamburrino, National Accounts Director, at 800-252-4821, ext. 500 - today!

A Salute to the Winners

The 1996 Information Technology Leadership Awards

Established in 1990 to enhance the Computerworld Smithsonian Awards, Leadership Awards recognize individuals whose vision and values have set positive examples. Recipients are individuals or teams who have demonstrated outstanding dedication, courage and cooperative spirit.

Sponsors of Leadership Awards select their own nominating committees, typically enlisting the expertise of colleagues, customers, influential business associates and policy makers. Nominating committees have a balanced mix of perspectives, with representatives from corporate America, technology, and academic and public policy bodies.

Telecom managers walk cautious line

By Kim Girard

To some corporate network managers, the Telecommunications Deregulation and Reform Act is merely a confusing and vague document that points them in no particular direction.

The pending megamergers borne of the new law have shaken up the telecommunications

market. But nearly six months after passage of the sweeping act, users are still unsure about making any moves.

And some say they have no intention of veering from a plan set months before the law was enacted.

"It's early yet," said Bob Domanski, manager of corporate communications at Ingersoll-Rand in Woodcliff Lake, N.J., which contracts with both Sprint Corp. and

AT&T Corp. for T1 and frame-relay service. "We've only planted the seed. It takes nine months to make a baby."

"This is a real challenging period for the corporate planner," said Tom L. Nolle, president of CIMI Corp. in Voorhees, N.J. "There's this huge shadowy figure on the wall called deregulation — the deregulation monster. We can

see its ugly image on the wall, but it's all shadow, no substance."

Over the next six to nine months, changes will begin to occur, and users will be following how the Federal Communications Commission moves to regulate and qualify potential carriers in new markets, Nolle said.

After the dust settles, analysts say users should expect more from the merged regional Bell operating companies, including

Deregulation

speedier introduction of broadband services in both local and long-distance markets and battles over pricing with interexchange carriers.

And utility companies will be poised to offer telecommunications services, such as voice and data links as well as Internet access.

Healthy competition

J. M. McGuire, manager of telecommunications and networking at Toshiba America Information Systems, Inc. in Irvine, Calif., said more competition under telecommunications reform is good news.

McGuire said he is unhappy that Pacific Bell has constantly changed the company's account representatives.

"I like being able to leverage our buying power against the local and long-distance carrier," McGuire said. He is currently looking to switch to AT&T for local service.

The ability to provide telecommunications services under the new law will offer plenty of opportunities for utility companies, said John Dubiel, manager of planning at Boston Edison Co.

But Dubiel said he is concerned about the equal access provision of the law, which outlines standards for a new carrier to meet. "People are concerned about this," he said. "Who can

Staying plugged in

Worried about the future of your data network under the Telecommunications Deregulation and Reform Act?

Here are some tips to guide you:

- Review current contracts and understand how they are tied to existing carrier relationships.
- Avoid signing any long-term agreements. Anyone with a large-scale carrier commitment should get an attorney to spell out the company's rights and responsibilities.
- Find out from the public utility commission what the alternative providers will be in each area of the country.
- Try to assess whether there

will be reasons to expect new services in your area. One test: Has your local exchange carrier or regional Bell operating company announced it is filing to get into the long-distance business?

• Be aware of what services might change most. For example, local exchange competition will affect high-bandwidth rates of T1 or higher.

• Watch for High-Bit-Rate Digital Subscriber Line (HDSL) opportunities. Speeds aren't up to that of a T1 line, which runs at 1.544M bit/sec., but the cost of installing HDSL over copper lines is cheaper and could become more available.

— Kim Girard

Deals and proposed mergers launched since the Telecommunications Act passed in February

April 1
SBC Communications moves to acquire Pacific Telesis for \$17B

April 21
Bell Atlantic and Nynex agree to a \$23B merger

May 1
MFS Communications buys UUnet Technologies for \$2B

May 17
MCI Communications and BellSouth agree to link their local telephone networks in five states

attach to your poles? What price can you get?"

Dubiel and Ray Sheedy, director of corporate communications at Walgreen Co. in Deerfield, Ill., said they are careful about their service contracts.

Sheedy said he shies away from long-term agreements and makes sure clauses are included so that the company can withdraw if access problems occur.

For Sheedy, telecommunications mergers mean more players and lower prices for business on services such as frame-relay access. It is only a matter of time before Integrated Services Digital Network access and Asymmetric Digital Subscriber Line flat-rate services to the Internet, which are offered to consumers, are also offered to businesses, he said.

Public groupware networks provide refuge from Web

Services gain steam despite AT&T Network Notes demise

By Tim Ouellette

Online groupware and electronic-mail services are sprouting up everywhere.

IBM's InterConnect for Notes offering on the IBM Global Network is now available, and Fabrik this week will enter beta testing of a public messaging-only service based on Microsoft Corp.'s Exchange Server.

When compared with the World Wide Web, commercial groupware over public networks is more secure.

"To be able to share information with and move data securely to other companies is important," said Ron Miller, president of Chart Links in New Haven,

Conn., which develops a Notes medical records application.

Also, the public network means that users need not build their own groupware infrastructure.

For example, IBM's InterConnect for Notes costs a minimum of \$2,500 per month and has a \$6,000 start-up price tag, but it still costs less than hiring a Notes administrator and maintaining hardware for a Notes network.

Fits the bill

Those services are a good option for medium-size companies that already have outsourced some of their information systems expertise and for Fortune 500 companies with overwhelmed IS staffs, said Scott McCready, an analyst at

International Data Corp. in Birmingham, Mass.

"A lot of times when a company decides on Notes, for example, they want to be able to roll it out fast to the rest of the organization," he said.

Users are signing up. VHA, Inc., a health-care alliance based in Irving, Texas, is using InterConnect for Notes to help its hospitals, which already use Notes internally, to share clinical information.

The Notes service will allow VHA hospitals to communicate with one another and with outside hospitals, a VHA spokesman confirmed.

A public Notes service is "critical because we are moving infor-

mation between multiple law firms and corporations," said Paul Zengilowski, president of Data Clearinghouse in Richmond, Vt. Point-to-point connections won't work because of the sheer number of connections needed to hook companies to hundreds of different law firms, he said.

Fabrik already provides public CC:Mail, Notes Mail and Microsoft Mail service over its network, with about 350 corporate customers signed up.

Update in fall

For its part, IBM's InterConnect for Notes service will initially be based on Notes 3.x. In September, IBM will offer InterConnect, which is based on a Notes update that combines Notes with a Web server.

And the new offerings keep coming.

Paul Zengilowski
of Data Clearinghouse favors the streamlined connections that a public Notes service can provide

US West Communications, Inc. (with Notes) and MCI Communications Corp. (with Exchange) have recently announced public groupware services.

Lotus Development Corp. said it has more than 10 firms lined up to provide public Notes networks. WorldCom and CompuServe, Inc. already have existing Notes offerings, with subscriber bases in the thousands.

Although AT&T officially killed its Network Notes service in March because of a lack of subscribers, the firm confirmed in April that it still will work with Lotus to integrate Notes into its Internet offerings.

"Initially, when we looked to do this, AT&T was the only game in town. But IBM has stepped up to the plate very quickly," Zengilowski said.

Time. To do your job. To think. To actually take lunch. With Lotus Approach,[®] time is what you'll be giving the entire MIS department. Because Lotus Approach is a powerful, easy-to-learn database that enables end users to manage and analyze corporate information on their own.

In fact, Lotus Approach is so easy to learn, your users can actually be productive within a few hours of opening the box. Which means rather than tapping you on the shoulder every five minutes, they can tap directly into your corporate data themselves. That's the beauty of Lotus Approach.

Just imagine: end users creating professional reports without you having to hold their hands. Business analysts building their own charts and crosstabs. Users with no programming

Analyze data for End On their own? And I get to go to lunch, right?

Computer Industry

Packard Bell, NEC join forces

Combo will focus on corporate PC market

By Bob Francis

Packard Bell Electronics, Inc. and Japan's NEC Corp. last week combined their PC businesses into an \$8 billion operation ready to assault the PC market, especially the corporate arena.

The combined firm, to be called Packard Bell NEC, will continue its push in the consumer market, where Packard Bell has held a large slice of the pie for several years.

But with the acquisition of NEC's U.S. assets and personnel, Packard Bell also gains entry into the corporate market.

The combined operations also will have a strong presence in the government market, via Packard Bell's purchase last year of Zenith Data Systems

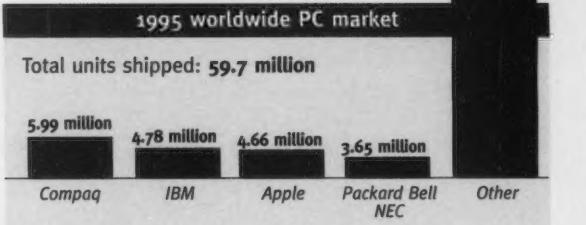

from Groupe Bull in France.

But even with the deep pockets and technical expertise of NEC, it isn't clear that the corporate market will welcome the Packard Bell nameplate.

The company has a poor reputation among corporate buyers, and its support organization has been geared toward consumers.

"They'd have to have a really compelling story to get in the door at most IS organizations," said Joanne Witt, an information systems manager at an Internet service provider in New Jersey.

"It's a challenge for them — not just the brand, but the various channel conflicts between NEC, Packard Bell and Zenith," said Richard Zwetchkenbaum, an analyst at International Data Corp., a

Source: Dataquest, San Jose, Calif.

research firm in Framingham, Mass.

Packard Bell NEC's operations will be based in Westlake Village, Calif., and headed by Beny Alagam, the founder of Packard Bell.

Alagam will retain his titles of chairman, CEO and president.

Transaction action

Packard Bell NEC will be the fourth-largest PC manufacturer in the world, after Compaq Computer Corp., IBM Personal Computer Co. and Apple Computer, Inc.

Under the terms of the complex transaction, Packard Bell will receive \$300 million in NEC assets, while NEC

will get more of Packard Bell's shares, somewhere between 35% and 40%. With an earlier infusion of cash, NEC gained a 20% stake in Packard Bell.

Privately held Packard Bell's 1995 revenue is estimated at slightly more than \$4 billion, nearly all of which came from the consumer market.

But the company didn't make money last year, largely because of its purchase of Zenith Data and because it miscalculated which Pentium chips consumers would purchase during the lucrative Christmas buying season.

& Multimedia notebooks take a bow. See page 43.

Apple plan rocks the boat

By Lisa Piscariello

Users are already noticing that Apple Computer, Inc.'s latest restructuring is upsetting established relationships with the company.

But they say they are willing to give the reorganization a chance if Apple can turn things around.

Apple two weeks ago announced it would create the following four profit centers: imaging, Macintosh computers, information appliances and alternative platforms.

Cutting across and serving each of those units will be AppleSoft, which will focus on interface and tools design; Advance Technology, which will focus on future products; AppleNet, which will target the Internet; and Reliability and Quality Assurance, which will

provide service and support.

One user said the restructuring was a good move for Apple, but destroyed her firm's relationship with the company.

"The reorganization closed the regional office that we dealt with, and our representative is now supporting more users," said Sue Rusiecki, the lead consultant in end-user services at Mount Holyoke College in South Hadley, Mass. The college has 500 Macintoshes and 500 PCs. "We used to have access to a systems engineer that knew a lot about us. Now, we don't have that continuity," Rusiecki said. "There is no more personal relationship, but

we'll deal with it if this restructuring will help Apple in the long run," she said.

Others said they are also willing to be patient. "Look, things

couldn't get much worse than they have been over the last year, so if this works, I'm all for it, even though it makes things a little hard on us," said an information systems manager at an East Coast investment banking firm. He requested anonymity.

Capps resigns

Just as the new guard laid out its restructuring plan, one of the old guard announced his resignation last week.

Steven Capps, who was hired in 1981 by Apple co-founder Steve Jobs, was instrumental in developing the Macintosh's graphical user interface. Capps said he is feeling burned out and wants to pursue software development related to the Internet.

Industry observers said Capps' departure is a blow to Apple because he represented a link to the company's past as a technical innovator and leader. Capps is part of the "brain drain" that has been happening at Apple for more than a year.

But one analyst said the upheaval is just an expected and temporary problem.

Apple last week issued \$575 million in bonds that three years from now can be converted to stock worth \$29.21 per share. Apple will use the money as working capital.

Briefs

Internetworking consolidation

Cabletron Systems, Inc. in Rochester, N.H., has acquired Zeitnet, Inc., an Asynchronous Transfer Mode adapter card vendor in Santa Clara, Calif. Cabletron paid about \$140 million. Adapter card maker Adaptec, Inc. in Milpitas, Calif., acquired Cogent Data Technologies, Inc. in Friday Harbor, Wash., for \$68 million.

Outsourcer's apprentice

Affiliated Computer Services, Inc. (ACS) in Dallas expects to be the nation's fourth-largest outsourcer of data processing services. ACS last week announced its impending acquisition of The Genix Group, Inc. in Dearborn, Mich., for \$135 million in cash, which will be covered by offering about 4 million shares of ACS stock. The acquisition yields revenue

of more than \$500 million.

Family ties

John Sculley, former chairman of Apple Computer, Inc., is forming an investment firm with his two brothers. The Blackburn Group will be comprised of David Sculley, senior vice president at H. J. Heinz Co.; Arthur Sculley, former managing director at J. P. Morgan & Co.; and John

Services spin-off

Platinum Technology, Inc. in Oakbrook Terrace, Ill., has formed a services subsidiary to help information technology groups develop and manage enterprise-scale projects. Los Angeles-based Platinum Solutions, Inc., debuts with a staff of 450, regional and international offices and \$60 million in revenue. Platinum formed the subsidiary by combining its education division with several professional services acquisitions. Those include Axis Systems International, Inc., Locus Computing Corp., Paradigm Systems Corp. and Trinamic Corp.

*No longer makes hardware. **Being acquired by Silicon Graphics, Inc.

TOP 5 SMP PLATFORMS

1. Digital Equipment Corp.
2. IBM
3. Cray Research, Inc.**
4. Sun Microsystems, Inc.
5. Sequent Computer Systems, Inc.

FOR THE past 15 years, the National Association of Securities Dealers (NASD), which operates the Nasdaq Stock Exchange, has been running its financial and human resource applications on a Tandem Computers, Inc. Himalaya K10000 parallel mainframe.

But when NASD wanted to modernize its operation with an application set from PeopleSoft, Inc., it found that PeopleSoft didn't offer a version for the Tandem machine. "One of the difficulties with Tandem is that it doesn't have a lot of off-the-shelf software," says Sam Laughery, vice president of production services for the Rockville, Md.-based association.

NASD's decision: Implement the new applications on a Unix symmetrical multiprocessing (SMP) server, a 10-CPU Symmetry SE70 from Sequent Computer Systems, Inc.

NASD also recently implemented its central registration of 510,000 stock-exchange brokers on another Sequent SE70 machine. Nasdaq, which experienced an 802-million-share trading day earlier this year, has assembled the capacity for a one-billion-share day by the end of the year, although that trading level is not expected until next year. Laughery is confident his existing Sequent cluster can be upgraded to handle the broker authorizations required to support that level.

"SMP was really the only answer for us," echoes Ed Morgan, NASD's director of computer operations at the association's data center in Rockville.

Best of both worlds

Laughery and Morgan are not the only ones reaching this conclusion. Many analysts believe that applica-

That's only part of the story. The time is fast approaching when both shared memory (or SMP) and distributed memory (or MPP) nodes will operate in one hybrid system. Laughery, for one, finds that prospect very appealing. "It means almost unlimited capacity when you put the nodes together," he says.

Combining the two technologies is "what the future is going to look like," insists Marcy Rosenkrantz, associate director of supercomputing technologies at the Cornell Theory Center at Cornell University in Ithaca, N.Y.

Researchers at the Cornell Theory Center, which operates the world's largest MPP, a 512-processor IBM SP machine, are investigating practical I/O configurations and other communications issues for these hybrid systems. "I don't think there is any argument that the technologies are coming together," Rosenkrantz says.

Many MPP and SMP vendors agree. Sun Microsystems, Inc.'s SPARCserver, the Exemplar SPP from Hewlett-Packard Co.'s Convex Technology Center, IBM's SP PowerParallel line, Silicon Graphics, Inc.'s Challenge, Sequent's next-generation NUMA-Q design and Pyramid Technology Corp.'s Reliant RM1000 are all grouping sets of CPUs as SMP nodes and arranging nodes in parallel, says Michael

MPP **MASSIVELY PARALLEL PROCESSOR:** A system that uses more than 16 processors in a distributed-memory, scalable, parallel architecture that can scale to more than 64 processors.

SMP **SYMMETRICAL MULTIPROCESSOR:** A system that supports a physically shared memory model, has a bus or switch-based architecture and can scale from two to 64 processors.

COMBO **THERE'S A NEW MODEL:** Tomorrow's systems will merge the two technologies, creating hybrid systems and having profound consequences for buying decisions of the future.

tions once deemed exclusive to massively parallel processors (MPP) are now finding homes on SMP systems, typically clusters of SMP machines. The reason: After a dozen years of development, the speed and scalability of SMPs has enabled them to muscle in on MPPs' domain.

The consensus is that MPPs are going away and the market will be taken over by shared memory machines, says Carl Kesselman, computer science instructor at the Beckman Institute at the California Institute of Technology in Pasadena.

SATISFIED CUSTOMERS?

Ease of use translates into higher satisfaction levels among SMP users.

MPP & SMP

Burwen, analyst at the Palo Alto Management Group, a high-performance computing research firm in Mountain View, Calif. (For details on these and other systems, see page 11.)

And to boost performance, vendors are replacing the passive buses typical in older generation SMPs with intelligent interconnects that move data between processors at higher speeds.

Because the new designs combine multiple CPUs per node, they promise

to double, triple or even quadruple the number of CPUs inside the cabinet. For example, Sequent's NUMA-Q machine, due out by the end of the year, will scale up to a maximum of 252 CPUs, with higher CPU counts planned for future generations. (NUMA stands for nonuniform memory access, meaning the different forms of memory — main, first- and second-level caches — in an SMP machine have been reconciled as a shared pool).

NASD's Laughery plans to make the move to the NUMA-Q machine as soon

as possible. "We will be one of the early adopters," he says.

These innovations will help SMP servers address what analysts say was their chief weakness: scalability. It also will help propel the growth of high-performance computing from \$2.5 billion in 1994 to an estimated \$14.3 billion in 1999, an increase of 41% a year, according to Burwen at the Palo Alto Management Group.

MPP's advantage

While SMPs are gaining ground, MPPs retain an advantage in availability and reliability. Since their processors can be partitioned into

segments that back each other up, the machines are not as prone to crash. Tandem, for one, uses a dual parallel architecture to give its K series of MPPs a cherished fault-tolerant label.

On the other hand, when one processor of an SMP machine stops, all the CPUs grind to a halt, says Gregory Pfister, senior technical staff member of the IBM RISC System/6000 Server Group in Austin, Texas.

But no matter what the hardware, to work to its full potential, a parallel machine needs a program to break the

task down into parallel parts. That is the challenge faced by Goodyear Tire & Rubber Co.'s Research Center in Akron, Ohio.

Goodyear uses an eight-processor Convex Exemplar SPP (scalable parallel processor) for finite element analysis of rubber parts. The Convex system is the first NUMA machine developed with a high-speed crossbar switch. But during analysis, the Exemplar SPP tops out at four processors, says Anthony Adams, a Goodyear associate scientist.

Goodyear's problem, surmises Steve Wallach, chief technology officer at HP's Convex Technology Center in Richardson, Texas, is that the application is only partially "parallelized." It takes advantage of four processors, but part of the job still runs serially, as if on a single processor. When that part runs, other processors sit idle, he notes.

Intel on the horizon

SMP's simpler, shared-memory designs undercut MPP, but SMP vendors are looking nervously over their shoulders at a new commodity component that is even simpler and cheaper. Intel Corp. is seeding PC-server makers with a four-way Pentium Pro board so they can stamp out low-end parallel servers. The first models are expected in volume late this year.

A server based on the Pentium Pro board may retail for \$50,000 or less, says the Beckman Institute's Kesselman. Many four-way SMP systems list for three times that, while a comparable four-processor MPP goes for about \$300,000. ■

Babcock is Computerworld's technical editor.

SPENDING: SMP LEADS IN '96

Reversing a trend, more is expected to be spent this year on SMP than MPP systems.

*63% of MPP users and 67% of SMP users anticipate adding to their systems this year. The figures reported here are average spending levels.

the Big Dig

BY MICHAEL GOLDBERG

A MATTER OF SCALE

Intermountain Health Care, Inc. in Salt Lake City, which operates hospitals, health insurance plans and health maintenance organizations serv-

ing 500,000 people, is working to connect its network of groups to a central data repository. The first phase of the project currently links health clinics to central administrative offices; decision-support applications, however, won't be ready before this summer.

Because it has hundreds of gigabytes of legacy data and expects to collect another 600G bytes in patient, billing and

other records annually, the company decided it needed processing scalability. It picked an IBM SP2 (or RS/6000 SP) MPP system as its data warehouse hardware platform.

Blake Jensen, assistant vice president for information systems, says Intermountain is confident the SP2 will handle all of its processing needs. Still, he acknowledges that his

Continues on page 8

When your warehouse needs more horsepower, you have a choice: Go for either scalability or reliability.

THE ABILITY to grow. That was the overriding concern of IS managers at MCI Telecommunications Corp. when they evaluated hardware options for a data warehouse to support their ever-growing log of long-distance calls.

A company dealing with millions of new records every hour, MCI needed a

MAKING THE MPP/SMP DECISION

Ken Rudin, managing director at Emergent Corp., a San Mateo, Calif.-based consulting firm and systems integrator specializing in parallel systems, suggests asking six questions before making the MPP/SMP choice:

1. What is the purpose of the application you are setting up?

SMP draws the nod for most mission-critical applications, which usually don't require access to extremely large amounts of data. MPP is the choice for tasks that require complex analytical looks at mounds of historical data.

2. Is the application transaction-oriented or decision-support-oriented?

SMP is a good choice for most on-line transaction processing (OLTP) and small to medium-sized decision-support systems (DSS) for its relative stability. MPP requires extra programming effort to coordinate the processing of separate nodes. MPP is a good selection for large DSS operations because response times to end users can be much faster than with SMP.

3. How much do you expect your data warehouse application to grow over time?

For slow, steady growth — less than 20% per year — SMP is the choice. The scalability of MPP systems can handle data stores that are rising quickly and unpredictably — more than 50% per year.

4. How much I/O scalability do you need?

SMP platforms are easy to run when disk space ranges from 10G bytes to 100G bytes. The scalability of MPP systems means large disk stores — more than 200G bytes — won't create processing bottlenecks.

5. How many end users are you supporting?

SMP systems handle between 200 and 500 users well in OLTP. MPP is the answer for 2,000 users or more, and proprietary systems tend to be more stable than open systems at this level.

6. How much transaction throughput do you require?

SMPs can handle between 2,000 and 5,000 end-user transactions per minute. The scalability of MPP systems means they can handle 10,000 or more transactions per minute, with proprietary systems generally offering more stability.

Continued from page 6

scale to where I think we will be growing," says

Bob Mohan, systems architect. MCI's decision: Go with a massively parallel processor (MPP) from IBM. "Why would I ever buy a machine that doesn't have the horsepower to do the job?"

The business and IS decision-makers at HealthPartners, Inc., a Bloomington, Minn.-based health maintenance organization (HMO), faced a different set of challenges when they started constructing a data warehouse last year.

Problems arose after mergers left the HMO with a diverse set of information systems that took too long to analyze data, sometimes a day or more for routine reports. Building a data warehouse became a way to create a common data set, which would result in more effective decision-making and faster response times.

For the three-year data warehousing project that began last May, HealthPartners chose a symmetric multiprocessing (SMP) server from Digital Equipment Corp. because it offers a very large memory — up to 14G bytes of capacity in the AlphaServer 8400.

Data WAREHOUSING and Mining

Building a data warehouse is a challenging process that can take a lot of people and time, users warn. Time is needed to train staff, and consultants are often required. There are choices to make about a database management system and decision-support tools, and it can be problematic to get end users from different departments to find a common way of looking at company information. And, with all these decisions, come the hardware questions. Picking the right platform is critical to the success of a data warehousing project.

The ability to harvest strategic benefits from the mountains of information a business collects is the promise of data warehousing. And it's the goal of a growing number of corporate IS departments.

The Gartner Group, Inc., a Stamford, Conn.-based market research firm, predicts the market for parallel processing computer systems, driven by client/server applications accessing data warehouses, will reach \$5 billion by 1998. That's up from about \$1 billion in 1995. And Smaby Group, Inc., a Minneapolis market research firm spe-

Continued from page 6

staff has hit some bumps along the way.

Jensen says specialized disks for the SP2 arrived several months later than expected, and the Oracle Corp. parallel database system was about a year late in arriving. IS managers also have needed more time than anticipated to transition to a client/server system. But Intermountain remains committed

Intermountain's Blake Jensen: "We have stumbled along the way."

to the data warehouse project.

"This is a business-critical application for us, and we were willing to put in the time and effort. [But] we went into that a little bit naively, not understanding what would be required, and we have stumbled along the way," Jensen admits. ■

cializing in large systems, estimates the demand for very large database and decision-support systems will surpass \$2 billion per year by 1999, more than twice what it was in 1995.

At MCI, strategy considerations followed necessity. The Washington-based company is busy, handling approximately 300 million long-distance calls daily. Federal regulators require the company to keep call-detail records, which contain enough information to reconstruct every customer connection, for up to two years. In addition, MCI realized that valuable nuggets of information about dialing behavior were drifting around in the continuous cascade of data.

Mohan says MCI chose a hardware platform suited specifically to the scalability needs his company faces. But the ongoing process of implementing the MPP system has not been headache-free. "The biggest challenge is the effort it takes to develop the software. Buying software or developing software is fraught with peril," he says.

Also, the scalability of MCI's MPP system comes with programming questions that take time and expertise to answer correctly, Mohan adds.

To build its warehouse with the needed scalability, MCI last year chose a massively parallel SP2 system from IBM to replace a series of 14 networked IBM RS/6000 servers. The SP2 system is expected to be in place by July in MCI's Colorado Springs, Colo., data center.

MCI spokesman Ted Jones says long-range goals call for linking the company's call-detail records ware-

house to its other decision-support systems, with an eye toward targeting consumers with products that appeal specifically to them.

In HealthPartners' case, the data warehousing goals are similar: improve the efficiency and quality of services.

A key challenge for the HealthPartners IS team is to figure out which

DIGGING FOR DATA

TOP 3 MPP/SMP DATA WAREHOUSING/ DATA MINING APPLICATIONS

1. Customer/marketing/ demographic analysis
2. Financial/securities analysis
3. Manufacturing analysis

Source: Computerworld/IDC survey

pieces of data are most important to answer end users' queries. IS staffers want to set up key summary tables that will answer most analytical questions, pared down from hundreds of gigabytes of raw data, according to Bill Easton, an IS project leader at HealthPartners.

Setting up these tables in the memory of the Digital SMP server will make end users' queries a function of the computer's I/O system and the

Oracle Corp. database-management system that HealthPartners is getting, says Bob Landrud, another IS project leader at HealthPartners. The results will be faster processing. When it is done, the IS team expects to provide some reports in minutes that used to take a day or more to generate.

Easton says there are three hurdles to the HMO's efforts thus far. The first, a time-consuming issue, is getting a diverse user community — from internal marketing and medical staff to external customers, such as health care providers and employer groups — to reach a consensus on the types of information they need to deliver improved services.

The second is making sure IS staff and end users understand the kinds of information, such as patient records, that are legally accessible to them. The third challenge involves the realization that a project like a data warehouse takes on a life of its own, and that its focus quickly evolves from a practical mission to a strategic one. "We want to get the data in place as rapidly as possible ... to facilitate some of the analytical activity," Easton says.

The hardware decisions of both MCI and HealthPartners add fuel to an ongoing debate among information systems professionals about the relative benefits of MPP systems and SMP systems. In general, users and analysts agree that MPP systems require more programming know-how and maintenance effort to keep the machine and the applications running smoothly. An SMP system, meanwhile, generally is easier to manage, because it provides a

Continues on page 10

database system. It also wants to use a Unix-based SMP server to process queries against a 1T byte data warehouse. Sears has run benchmarks to find the hardware vendor that best suits its needs, says Norman Frees, a technical consultant for strategic infor-

Continues on page 10

FUTURISTIC SOLUTION

National retailer **Sears, Roebuck and Co.**, a longtime user of MPP systems, is going for an SMP look with a new, strategic data warehouse system.

Sears' existing NCR Corp. computers will remain, but the company intends to standardize some analytical applications around its Informix Software, Inc.

Continued from page 9

single image to a computer's operating system and software applications. Users usually don't need to rewrite applications intended for SMP machines.

However, SMP systems do not scale as well as MPP systems do; that is, after a certain point, they do not provide a proportional increase in performance for every processor added to a system.

This is why vendors such as Hewlett-Packard Co., Sun Microsystems, Inc. and Digital offer SMP servers that scale up to 12 processors. Adding more chips to these computers doesn't boost performance much, analysts suggest.

On the other hand, MPP vendors such as IBM, NCR Corp. and Tandem Computers, Inc. offer computers that scale to hundreds or thousands of processors and show improved processing performance.

SMP vendors are working to overcome scalability barriers. Some, including Digital and Pyramid Technology Corp., offer the ability to cluster servers, lashing computers together to make up a larger system for improved scalability or for backup in case one system fails.

Others, such as Sequent Computer Systems, Inc. and Data General Corp., plan, by year's end, to offer systems that simulate the shared-memory access of an SMP system in a parallel scheme with dozens of processors. These companies say they can accomplish this using supercharged silicon and special four-processor boards from Intel Corp. to get the scalability of MPP systems without having to reprogram software applications.

Such innovations tend to blur the

distinctions between SMP and MPP systems, while narrowing the appeal of strictly massively parallel systems, observers say.

"The bottom line is that it's a religious war [when you] ask which is better: SMP, clusters of SMP systems or massively parallel machines. Each one is appropriate in different situations,"

says Ken Rudin, managing director at Emergent Corp., a systems consulting firm in San Mateo, Calif.

The largest implementations of a decision-support system need the processing power and scalability that an MPP system offers, Rudin argues. These are the decision-support sys-

tems supporting dozens or hundreds of users who throw queries at a data warehouse containing hundreds of gigabytes or terabytes of data. And though it requires more time and money to install and support an MPP system, the strategic gains can be great, he says.

Other participants in the debate are skeptical of the practical commercial benefits of MPP systems.

Robert Tholemeier, an analyst at Meta Group, Inc., in Stamford, Conn., compares the challenge of maintaining a massively parallel machine to the television performers on "The Ed Sullivan Show" who would keep numerous plates spinning atop long, narrow sticks. Even the best performers broke some dishes.

"[With] the implementation of [MPP systems], you're asking for a management nightmare," Tholemeier says. "The data has to be finely partitioned. You have to be careful, and we expect you'll never get it [perfectly] right."

Combined with the right database and decision-support software, SMP systems offer good performance when used with a data warehouse of hundreds of gigabytes, Tholemeier adds. IS managers who pare down the raw business data to meet end-user needs can help speed up the query process as well. Information technologists "make the mistake of thinking, 'How much data will we need?' instead of [asking] users, 'What problems do [you] have?'" he says. ■

Goldberg is Computerworld's senior writer for mainframes and high-end storage.

Continued from page 9

mentation systems at Sears' Hoffman Estates, Ill., headquarters. A decision is expected late this year.

Although heavy computational jobs still exist for MPP systems, it's looking more like an SMP future, Frees says. "Even if the scalability of SMP isn't there immediately, it will be there," he says.

The goals of the data warehousing

The new SMP system will help Sears analyze consumer data and respond quickly to market trends.

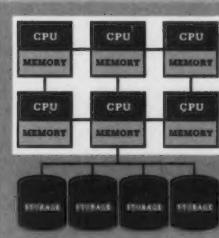

project are to use the information to understand customers better, respond to market trends quickly, extend Sears' geographic reach and analyze ways to cut costs. "We're going for a competitive advantage through our use of that kind of information," Frees says. ■

Major players in the field

MPP

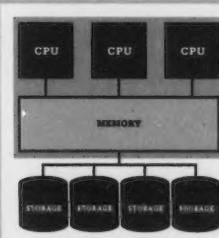

systems are collections of central processing units (CPU) — typically 16 or more — in which each CPU has its own memory. To reap the benefits of MPP, applications must be written so that computations are shared among the CPUs, allowing the system to divide and conquer. Although MPPs are often very complex, they do scale well.

SMP

machines are smaller than MPPs — they scale from two to 64 CPUs — and have shared, instead of distributed, memory, which is accessed through a bus or switch-based interconnect. SMPs can be clustered on a network, and some next-generation architectures are evolving that allow both MPPs and SMPs to operate on the same network.

SURVEY METHODOLOGY

In January, *Computerworld* and International Data Corp. conducted a telephone survey of 80 IS managers at organizations that are using either MPP or SMP (40 managers from each group) in a cross section of industry sectors. About 38% of the IS managers surveyed were at academic institutions or government agencies; the rest were at corporations. The organizations that were surveyed had an average of about 200 IS employees.

For complete survey results, please go to *Computerworld's* Web site at <http://www.computerworld.com/mpp>.

The NCR Scalable Data Warehouse.

Half the world relies on our data warehouses.

If you're serious about using data warehousing to gain a competitive edge, choose NCR. The company that IDC says is number one worldwide in data warehousing.¹

**#1 IN DATA
WAREHOUSING**

We have the technology and expertise to help you transform mountains of data into nuggets of vital customer information to help you make smarter, quicker decisions. With industry-leading databases like Teradata[®], Oracle[®], Informix[®] and Sybase[®].

Know-how that, in the US, the three biggest retailers, three of the top five airlines, five of the seven regional phone companies, and two out of three top banks are already utilizing. Know-how that has made us the world leader in data warehousing with a 50% share, and number one worldwide in UNIX medium-scale systems for two years running.²

It's clear: the best system to build your data warehouse on is one of our new, highly scalable

WorldMark[™] servers. The only platform that scales from SMP to clusters, to MPP, allowing businesses to start their data warehouse small and grow it to any size.

The world's most experienced data warehouse professionals can help you set up and maintain the most scalable data warehouse on the planet. To get more information about NCR's scalable data warehouse, call 1-800-CALL-NCR ext. 3000. Or experience our data warehousing capabilities firsthand at: <http://www.ncr.com>

Intranets

THE MANAGER'S GUIDE TO WHAT'S REALLY IMPORTANT

What
managers
really
need to
know.

Your corporate intranet - how are you going to build it? Technology phenomena always produce info-gluts - tons and tons of reports, product announcements, articles. What's it all mean?

Computerworld Intranets is the only publication designed to help both technology and business managers sort through the mountains of material on intranets so they can effectively harness the power of the technology to support corporate objectives.

Each month, Computerworld Intranets will show how you can put Web browsers and other standard Internet technology to work in your internal company networks.

We'll boil down key issues for managers. We'll deliver analysis, advice from leading consultants and users, case studies and valuable online and printed resources:

1 A MONTHLY MINI-MAGAZINE: In 8 highly focused pages, Computerworld Intranets delivers the bottom line on cost/benefits, security, database integration, politics and other must-know topics.

Computerworld
Intranets debuts in
the June 24th issue of
Computerworld.

2 ONLINE: A new Intranets "web-zine" on Computerworld's home page, @Computerworld (www.computerworld.com), delivers expanded information of practical use to managers. Checklists. Project plans. RealAudio interviews with other high-level managers. Links to the best Internet resources. Plus interactive forums and polls to help you find the best ideas and techniques.

On June 24th, check us out at

Computerworld Smithsonian Awards

Honoring those who bring great ideas to life

By Julia King

Three decades ago, David Evans co-developed revolutionary techniques for computerized visualization. Today, his computer graphics technology is used for everything from developing artificial organs to designing new airplanes and simulating their performance before they take to the skies.

Last week, in front of a wildly applauding crowd of more than 800 industry leaders, Evans was honored for his lifetime achievements and courage.

Many in attendance were moved to tears during an emotional presentation at the Eighth Annual *Computerworld* Smithsonian Awards in Washington.

Evans, who has Alzheimer's disease, was escorted to the podium and supported by his co-developer, Ivan Sutherland, and his two sons.

Peter Evans accepted the award on behalf of his father, amid a five-minute standing ovation.

Innovators honored

The *Computerworld* Smithsonian Awards honor the creators of information systems that benefit and advance society.

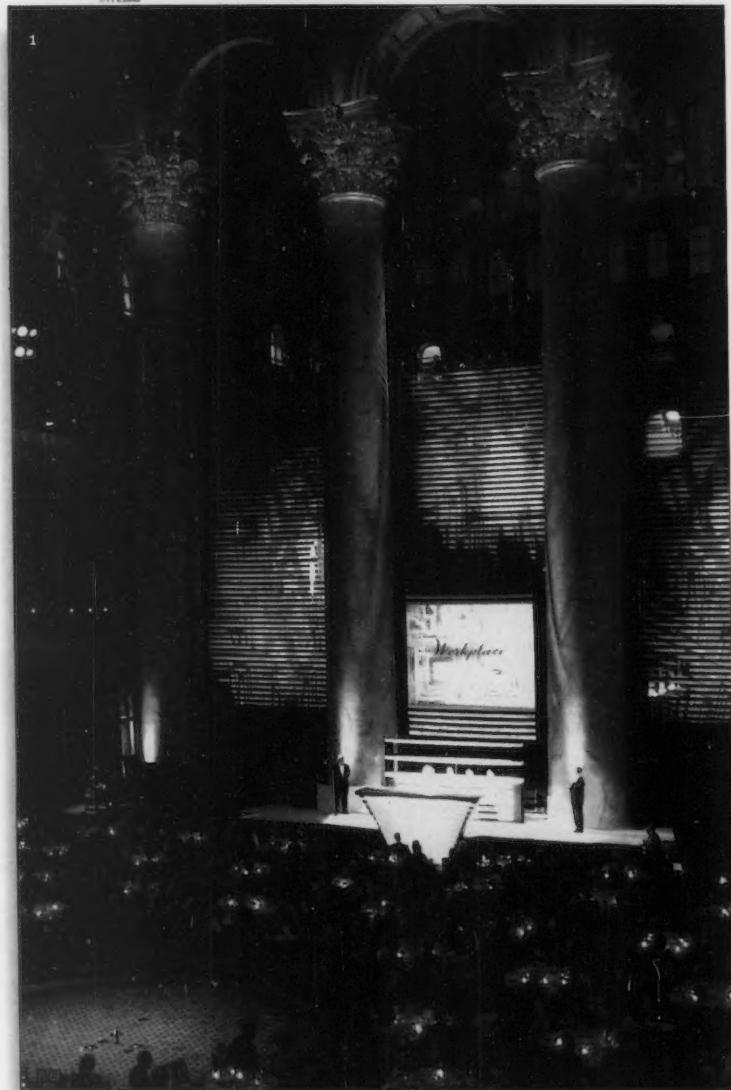

This year, 10 winners made their way to the podium beneath the towering marble pillars of the National Building Museum to accept awards for their varied accomplishments.

The New York City Public School for the Deaf won an award for its CD-ROM-based sign language program.

"For us, information technology has made a formerly invisible world visible," said Susan Abdulezer, whose City Kids Guide to American Sign Language CD-ROM program offers a new and more flexible way to teach and learn language.

Other winners cover a wide range of disciplines (see box, next page), from the state of Texas' computerized immunization tracking system to Farmland Industries, Inc.'s portable global positioning system, which helps farmers in the field collect data to better manage crops.

"Information technology is indeed a universal language which breaks down artificial boundaries and categories and invites us all to understand, and use, great ideas wherever they arise," said Patrick J. McGovern, chairman and CEO of International Data Group, the parent company of *Computerworld*.

1 Washington's National Building Museum, where about 800 guests gathered for the Eighth Annual *Computerworld* Smithsonian Awards last week

2 Graphics pioneer David Evans (second from right) is supported onstage by his long-time colleague Ivan Sutherland (right) and his sons, Peter and David Jr. Peter Evans told the crowd how "the love and admiration" of family and friends is sustaining his father in his battle with Alzheimer's disease.

3 Susan Abdulezer, multimedia coordinator at the New York City Public School for the Deaf, with Gary Beach, president of Computerworld, Inc.

4 Vinton Cerf, the acknowledged "father of the Internet" and co-developer of TCP/IP, received the MCI Leadership Award

5 Award nominees from AlliedSignal Technical Services include (from left) Henry Debnam, Eric Singleton, Paul Hoedeman and Ivan Stern

6 Ann Syptak of the Texas Department of Health celebrates her agency's award for a statewide immunization tracking system

7 Tom Porter, visual effects supervisor at Pixar Animation Studios, accepted an award for the animated film, *Toy Story*

8 Patrick J. McGovern (right), chairman of International Data Group and the Smithsonian Awards Committee, chats with attendees

9 The winners assembled

We give the world's top CIOs client/server/web applications, a secret weapon, and a strange aversion to cameras.

CIO,
Major Insurance
Company,
name withheld.

So you're looking to build the next generation of client/server applications. And give your company a major competitive weapon. Well, these days,

some of the world's best CIOs are doing just that. And putting them to work on the web.

It's more than home pages.

When most people think of the web, they think of static pages. Brochureware. Not the kind of applications you'd expect to have a major impact on your business. But at ParcPlace-Digitalk, that's exactly what

we let you create—client/server/web applications—business-critical applications that actually run on the web.

Until now, the only way to build web applications was to use an

assortment of HTML, CGI, C, Perl, and SQL tools. In all, developers had to know at least five languages and five environments. But that was before VisualWave.

VisualWave. The first integrated solution. We designed VisualWave to give you an integrated development and deployment

*VisualWave
Official secret weapon
of the Global 1000*

*Business-critical
client/server/web
applications*

CO,
Major Telephone
Company.
he's not talking.

DIO,
Major Financial
Services Company.
requests total
anonymity.

environment. Including database access, a web delivery system, and an Internet Application Server. And we based it on object technology, so you can build, deploy, and maintain applications at a speed that keeps pace with your business.

You can even publish client/server Windows applications directly on the web. Of course, VisualWave supports Java and ActiveX. And it runs on the 12 most popular client/server operating systems, as well as the industry-leading browsers.

Supports
Java applets
and ActiveX

So why the aversion to cameras? If you found a more strategic way to run your business, the fastest way to respond to change, and an integrated client/server/web solution, would you tell your competition

about it?

Maybe not. It looks like our customers don't want to give away any secrets,

either. So if you want to see exactly what VisualWave can do, call us at 1-800-759-7272. Or visit www.parcplace.com. And get the VisualWave white paper on building client/server/web applications.

Editorial

ATM's flameout

I nearly choked on my muffin recently when I came across a story in *Computerworld* forecasting that the total size of the Asynchronous Transfer Mode (ATM) market in the U.S. this year would be \$246 million. That's roughly a rounding error in IBM's annual report.

Could this be the same scalable, high-speed switching technology that inspired predictions such as these just two years ago?

The market for ATM gear will grow from \$200 million in 1994 to \$1.4 billion in 1997. — Computer Intelligence/Infocorp

Worldwide demand for ATM will grow to \$3.1 billion in 1997. — Gartner Group, Inc.

The private ATM network switch market will exceed \$1 billion in 1998. — Dataquest

Now compare these forecasts from market researchers today:

"No growth" this year. — International Data Corp.

No widespread adoption of ATM until "1999 at the earliest." — Datapro Information Services Group

What's going on with ATM is a phenomenon that has been played out repeatedly in the technology-crazed IS field. New technology comes online to a flurry of excitement and overblown predictions before users have had a chance to cast their votes.

Well, in the case of ATM, the votes are in, and reality is the winner. ATM is an impressive technology, but it's too much, too soon for most IS organizations. Few users need even ATM's low-end 25M bit/sec. performance, and fewer still can stomach the \$30,000 to \$150,000 cost for an ATM switch.

In the meantime, frame relay continues to improve with access gear and is available at four-figure prices. Ethernet is scaling nicely to the 100M-bit range, and 1G-bit Ethernet backbones are just around the corner. IS people are buying this stuff because it works, it isn't expensive and it builds on existing investments.

The inflated forecasts for ATM are the product of an industry that easily falls in love with hot technology at the expense of common sense and market realities. Its disappointing market performance is a demonstration of the power that you, the customer, wield when you vote with your pocketbook.

Viewpoint

Letters to the editor

A damn tragedy

Actually, it is the sort of letter that you received from Dave Fraatz that has given political correctness a bad name [“Get the soap again,” CW, May 27]. He assumes the only usage of the word “damn” is one with a religious context; that is like a homosexual objecting to the word gay being used to describe someone’s happiness.

A real tragedy would be if we trashed our working vocabularies in order to remove every word that could possibly, in some context, offend someone, somewhere.

*Jim Van Lydegraf
Sun Valley, Calif.
jim@imssoft.com*

Inherently faulty

I must take exception to Laura DiDio's article on general protection faults [“Memory leakage the cause of GPFs,” CW, May 27], which blames hardware for the deficiencies in Microsoft's operating systems. I have a dual-boot system with DOS/Windows on the first partition of my hard drive and OS/2 Warp Connect on the second partition. Windows has a GPF a couple of times a day, whereas OS/2 has “trapped out” — the OS/2 equivalent of a GPF — only twice in the past seven months. Because both systems reside on the same Pentium, this would seem to be a valid comparison.

I have no doubt that GPFs are exactly that — the failure of a non-pre-emptive operating system to protect the operating system and applications from each other. Memory leak is a related issue that contributes to GPFs but could be controlled

by garbage collection and true pre-emption. Windows' design compromises and buggy application programming interfaces make it unsuitable for the tasks, or multitasks, that most corporate users require from a modern operating system. Windows 95 doesn't seem to be much of an improvement, so Microsoft is telling corporate customers to go directly to NT. I'll stick with OS/2.

*Philip Wright
Network consultant
Roswell, Ga.
pvwright@ibm.net*

But he does use turn signals

I have to disagree with Alan Horowitz' management article on “Weirdos” [CW, May 13]. Giving certain people in an organization preferential treatment is bad for morale. Allowing them to be the primary — or worse, sole — support for the company's online system places the business at risk.

There are plenty of non-eccentric people in the marketplace who not only have technical ability but are also capable of a team effort, communicating with upper management in terms they can understand and performing in a professional manner. These are people deserving the higher salaries — not someone who rides a bicycle in the hallway.

*Rich Ward
Cincinnati
richward@iglou.com*

How to stop laptop thieves

The FAA recently learned of a hustle being employed at airports across the country to steal laptops. It involves two people who look for a victim carrying a laptop and approaching a metal detector.

They position themselves in front of the unsuspecting passenger. They stall until the mark puts the laptop on the conveyor belt. The first subject moves through the metal detector, while the second sets it off and begins a slow process of emptying pockets, removing jewelry and so on.

While this is happening, the first subject takes the laptop as soon as it appears on the conveyor belt and moves away quickly.

When traveling with a laptop, try to avoid lines for metal detectors. When you can't do that, delay putting your luggage and laptop on the conveyor belt until you are sure you will be the next person through. As you move through the metal detector, keep your eyes on the conveyor belt, watch for your luggage and laptop to come through and look at what those in front of you pick up.

Heavyweights Square Off for Enterprise Imaging Crown

Ladies and gentlemen, welcome to "fight night" 1996. Tonight we have the battle for the desktop document imaging heavyweight championship of the world. The purse is reputed by some to be worth more than \$1 billion, so it is no surprise to find several contenders. At this time there are three heavyweights in the ring:

- In the red corner we have FileNet Corp. and Watermark Software Inc., weighing in with Watermark Enterprise Edition for any flavor of Windows client.
- In the green corner we have Wang and Microsoft, with imaging for Windows 95 and NT clients.
- In the blue corner: IBM and Lotus Development, with Lotus Notes:Document Imaging (LN:DI).

Why are so many heavyweights contesting this market? The main reason is that the stakes have increased dramatically.

The first generation of imaging, based on proprietary technology, automated a department. Second-generation imaging was dominated by vendors providing turnkey solutions using largely standard components. "Now we are in the third generation,"

notes Jordan Libit, vice president of marketing for FileNet. "Desktop document imaging is the first opportunity to showcase the business benefits of document imaging across the entire enterprise."

Although a contingent of analysts in the press box are murmuring about the absence of revenue streams, vendors remain steadfast in their belief that the winner's purse will be millions, maybe billions, of dollars.

It could be said that the "promoter" behind all this is Microsoft, whose slipstreaming of image viewing capabilities into Win95 at no cost set the ground rules for the fight. The idea of competing for the title of "Desktop Imaging Champion" on a giveaway basis is a classic Microsoft tactic. Like promoter Don King, Microsoft will get no share of the purse . . . but will get a hefty cut of the action surrounding the event. Its windfall should include significant incremental revenue from increased sales of NT, SQL Server, Back Office and, down the road, Exchange.

Round 1

The fight begins in 1992 when Watermark, in Burlington, Mass., puts on a display of fancy footwork by offering its \$99 Discovery Edition, a product that takes traditional production imaging vendors by surprise and captures the hearts — if not the wallets — of imaging fans around the world. Watermark wins this round uncontested.

This White Paper was prepared under the direction of Scott McCready, Program Director, Electronic Workplace Technologies, at International Data Corp. and Principal of IDC/Avante Technology, Inc., in Framingham, MA. He specializes in workflow, imaging, groupware and document management technologies as well as measuring the business implications of IT in general. Gerry Murray, Senior Analyst, Electronic Workplace Technologies, for IDC and a senior consultant for IDC/Avante, also contributed to the White Paper. He specializes in imaging and workflow technology. Together, McCready and Murray co-authored *Lotus Notes: Agent of Change*, a study that details the experiences of 65 companies, measuring the costs and benefits of technology investments as well as ROI calculations for each one.

Special Advertising Supplement

Round 2

As the rest of the industry roils with envy at the company's apparent success, Watermark — in spite of what its competitors think — concludes that Discovery Edition simply is not profitable. So the company repositions itself upstream with its Professional Edition and mothballs the Discovery line (except as an OEM product). Unfortunately, it starts to "trash talk" its old product, which hurts its OEM relationships. Watermark wins this round with minimal contention.

Round 3

Here come the big guns. Wang, the George Foreman of the imaging world, shows it can take a knockout punch and still get back in the ring. And like Foreman, who named all his sons George, Wang implements a similar level of naming redundancy by calling all its software products OPEN/something.

Wang uses a legal judo maneuver to bring Microsoft into its corner, parlaying this advantage into:

- Having Microsoft invest \$90 million in Wang
- Becoming the provider of desktop document imaging for Windows 95
- Being designated as Microsoft's preferred imaging supplier
- Being designated as Microsoft's preferred work flow supplier
- Gaining the inside track on Microsoft development efforts

This combination has Watermark reeling, yet Watermark somehow remains on its feet and opts for a "rope-a-dope" strategy while trash-talking Wang's ability to deliver. Wang draws first blood and wins this round unanimously.

Round 4

IBM buys Lotus Development for \$3 billion. Now the stakes are sky-high. With Lotus SmartSuite and Notes, IBM finally has a desktop software business. Since Notes comes with a free image viewer, IBM by default enters the desktop document imaging ring.

Not to be outdone by its larger rivals, FileNet buys Watermark — whose annual sales are \$6 million — for more than \$60 million! The crowd gasps! FileNet becomes an overnight contender but the cost is high. Each heavyweight now has not only

desktop document imaging but industrial strength production imaging as well. This round is a draw.

Round 5

In July 1995, Wang acquires Sigma Imaging, arguably the best NT implementation on the market, for \$20 million, then scores further for embracing NT as the dominant server platform and potentially the most popular networking system.

Microsoft launches Windows 95. Suddenly the fight has a worldwide audience, as IDC estimates there will be several million image-enabled Win95 desktops by the end of 1997.

FileNet and Watermark counter with a series of jabs, claiming that Wang's desktop capabilities will be too little too late, and that most Win95 users would benefit from upgrading to their Enterprise Edition. Wang absorbs these body blows and commits to building its Win95 imaging viewer before year-end. Wang wins this round.

Round 6

After the action-filled Round 5, all the contestants try to catch their breath before the next onslaught. FileNet and Watermark announce plans to integrate their different viewers, making Watermark desktop imaging compatible with FileNet's production imaging capability. Wang is busy building its Win95 capabilities; IBM is quietly rethinking its strategy with Lotus. By default, the points for this round are shared equally by FileNet and Wang. But IDC would have given Wang the round had it elected to resurrect its image viewer code for Windows 3.X.

Round 7

IBM announces a connection from Notes to IBM ImagePlus via a mail gateway, as well as a second phase of integration that will provide realtime links between the two products, using ImagePlus as the back-end store for Notes. This one-two combination establishes IBM as a premier supplier of distributed imaging. Lotus has a ready-made market for desktop imaging in the form of 15 million+ Notes and cc:Mail users. Add the 70,000+ IBM ImagePlus users, and IBM/Lotus for the first time looks like they have the measure of Microsoft and Wang. Round 7 goes to IBM/Lotus, and they take the lead

ENTERPRISE-WIDE IMAGING

White
Paper

Heavyweights vie to be "one-stop shop"

Wang holds the standard Microsoft interfacing piece and has a chance to be the de facto desktop imaging standard. Its OLE Automation implementation is based on the same multiple object layering as MS Word and Excel. And since Wang built its image viewer on a component model using OCXs (now called Active X controls), its viewer and toolkit let one use Access, Visual Basic or PowerBuilder to leverage the OCXs in a frame to build one's own custom application.

Wang's pact with Microsoft entailed developing an extension to the TIFF 6.0 file format standards spec for annotating images. The spec was made available to Microsoft developers in April. Says marketing director Tony Grimsditch, "[Wang] knows how to put an image into the Microsoft client environment in the most convenient way for a Microsoft Office user." The next major NT release will contain a version of the image viewer.

Once Wang supports Active X controls, its image viewer will be a pluggable component in the MS Explorer desktop. Wang has run image-enabled work flow over the Internet. OpenImage users can leverage Wang's desktop capability in their enterprise imaging plans. Wang also offers top-notch document management via a pact with PC DOCS. The missing piece — a Notes-like environment to automate white collar functions — is under development, but time-to-market is key; an acquisition may be a better route.

Watermark is still selling well even against free products. A \$49 option lets its Enterprise Edition client access the repositories of a **FileNet** production system — a boon for firms with investments in FileNet products or whose enterprise imaging vision includes desktop and production imaging.

After acquiring vendors of document management and COLD software, FileNet in April proposed an annotation portability standard with Adobe. Under this specification, annotations as-

Kodak developed **Lotus Development**'s original desktop imaging viewer. Lotus brought imaging development in-house in 1991, an effort culminating in LN:DI 2.6 and the coming Release 4.

Lotus' advantage, says product manager John Caffrey, lies in providing imaging capabilities to a mature, already rich development platform in Notes. Notes has broad platform coverage and unbeatable security down to the field level, so that a user annotating an image can decide at many levels who is allowed to read it, to change it or even to send it to someone else. In leveraging LN:DI's annotation capability, Notes has no competitors. But the LN:DI viewer should not be reviewed in isolation of Notes functionality.

Once IBM acquired Lotus, creating a link between ImagePlus (which is available on AS/400, AIX and MVS/ESA platforms) and LN:DI made sense. Notes users could take advantage of the repository capabilities of ImagePlus; ImagePlus customers would have a desktop imaging option.

A mail gateway between the two products was announced in December; integration at the API level is due later this year. Now, IBM customers can link front-office operations such as sales with back-office processes like invoicing. The reason for IBM purchasing Lotus now is clear. With Notes, ImagePlus and LN:DI, only document management is missing in what could be the richest one-stop shop for customers.

sociated with an image would remain intact while being converted to the PDF file format. The image and annotations could then be read by Adobe Acrobat.

FileNet has also worked with Novell to develop Ensemble, which allows Novell's Groupwise software to route work between two employees and to be integrated with Microsoft Exchange. All this makes FileNet a one-stop shop for firms automating paper-intensive processes.

on points because they have an economic model for desktop imaging that works! They can afford to give away desktop imaging as long as they sell Notes.

Round 8

Wang opens up in December, 1995, buys Avail Systems, a Boulder, Colo., vendor of hierarchical storage management (HSM) software, for \$32 million in stock. This plan of attack dovetails with Microsoft's future storage management needs for Cairo. More importantly, Wang for the first time has the foundation for fully integrated file management of all data types under the Microsoft/Wang model. The fight begins to go in Wang's favor.

Lotus counters with V4.0 of Notes and Release 4 of LN:DI. Release 4, scheduled for June 1996, looks like it will have significantly enhanced security for annotations. LN:DI is particularly appealing when one considers the platform coverage of Notes and the security features that LN:DI can leverage.

In Round 8, the points are shared equally by Lotus and Wang.

Round 9

The fight shifts to include more than just imaging at the desktop. Imaging is now seen as simply one component of the full desktop automation environment. Most customers begin to recognize that desktop document imaging should be purchased in conjunction with other technologies such as production imaging, work flow software, document management, groupware and Internet browsers. This development dramatically shifts the fight's momentum.

Wang releases its imaging for Windows 95 on time. The feature set exceeds press expectations. Win 95 now includes image display as expected, and Wang has built in scanner controls, fax in/out support and full annotation features. These components are built as OLE 2.0 modules that Wang and Microsoft distribute freely over the Internet.

Wang presents its annotation capability as an open, public format, unlike the private TIFF tags of other vendors. This specification should give customers a higher degree of compatibility between different vendor approaches. Round 9 goes to Wang, but many fight fans think it should have been able to get a standing count against FileNet and IBM.

Now everyone can manage the power of information!

MI³MS 3000™ Plus
Minolta Image & Information
Management Systems

Information is power. Until information overwhelms you. Then it stifles productivity, dulls your competitive edge and drives up costs.

MI³MS 3000 Plus streamlines management of all of your information.

Paper documents. Faxes. Microfilm. Text files. Mainframe reports. MI³MS can integrate all of these items into logical documents stored on optical disk.

Now you have all of your mission critical information in the form you need it – digital. Where you need it – enterprise-wide. When you need it – immediately.

Our workflow application heightens productivity. Windows™-based open architecture makes installation and training easy. Expert service and support give you the scaleable, customized solution you need.

In more than 2000 installed systems worldwide, Minolta Imaging Systems are proving that now you can manage all of your information in ways you've never imagined.

Call 1-800-9-MINOLTA

Information becomes totally manageable thanks to these MI³MS 3000 Plus features:

• P.A.T.H. 3.0 software easily adds software for expanded applications such as OCR and text search.

• TIFF/JBIG compression reduces storage, network communications and telephone costs by compressing files up to 200% more than CCITT Group 4 compression.

• I.C.E. software downloads internally generated reports and documents, storing them in MI³MS tables.

• DocRoute™ for MI³MS 3000 Plus is Windows-based and provides a seamless workflow application with intelligent routing, e-mail notification and status tracking.

Round 10

Wang has its opponents on the ropes, but fails to land the knockout punch. Although Wang is showing an impressive display of punching power, its opponents continue to move effectively in the ring.

After the exertion of getting imaging for Win95 in the box, Wang seems to be tiring. In spite of delivering a great toolset, Wang has not taken the fight home to the third parties, nor has it delivered an upgrade path to ignite the fans and provide a revenue stream. Nor has Win95 turned out to be the juggernaut that Wang expected.

Wang returns to its corner sputtering about OCXs on its home page, please download. On a brighter note, Wang ships 142 production imaging systems in the quarter ending 12/31/95, with revenues more than double the same quarter in 1994.

Meanwhile, FileNet is bulking up in preparation for a new strategic direction. Having already ac-

quired Watermark to fulfill its desktop imaging requirements, FileNet in January 1996 acquires for an undisclosed sum International Financial Software Ltd., the New York, NY developer of Greenbar Computer Output to Laser Disk (COLD) software and in February buys Saros Corp., a Bellevue, Wash., vendor of document management software for \$100 million. FileNet now has a punching combination that Wang and IBM can't presently match. FileNet releases Ensemble, a workgroup level work flow product, and brings Novell into its corner as a distribution partner. This shows that the Wang/Microsoft assault has only made FileNet a more hardened contender. Round 10 goes to FileNet.

 Round 11

FileNet plans to issue a joint specification with Adobe for annotations that support the PDF and TIFF file formats. It fails to mention that a public

Desktop Document Imaging

Document imaging — the technology that allows you to scan any business document, then display it as a bit-mapped image on a computer — has been around since the early 1980s. Vendors such as Wang, FileNet and IBM have done good business providing turnkey imaging systems that allow one to process literally millions of pieces of paper. These production imaging systems are installed in thousands of companies and every day more than 1 million workers process document images rather than sift through paper.

Desktop document imaging is suited for scanning the occasional magazine article and keeping a small number of images on individual hard drives. Desktop imaging should also allow one to occasionally access production imaging systems, thereby providing enterprise-

wide image access and display capability.

Desktop imaging differs from production imaging primarily by volume. A typical desktop imaging user might scan in a handful of documents at one sitting; a production site can scan thousands of images per hour. As a result, input capabilities, performance issues and storage requirements differ substantially from one system to the next.

IDC believes that for prospective customers to have an effective enterprise-wide imaging strategy, they should purchase desktop document imaging with production imaging in mind and also with how it will fit with future acquisitions such as groupware, document management, work flow and the Internet.

Desktop document imaging will increasingly be a standard compo-

nent of most PCs. Viewing technology has already been subsumed into the operating system and is also available as a free Internet browser plug-in. Personal scanners are being bundled into PCs and keyboards. Thus, a grassroots introduction to the technology will take place in the mainstream market over the next three years.

But users must realize that desktop imaging is not an end in itself. Its true business benefits will be achieved only if it is tightly integrated with an ambitious vision of automation at the desktop. The market is already evolving along these lines and the integration and standardization work underway will ensure that the value proposition for customers will continue its dramatic increase.

ENTERPRISE-WIDE IMAGING

**White
Paper**

Special Advertising Supplement

annotation specification has been available from Wang and Microsoft for some time. FileNet's specification is preliminary and is not compatible with what is already available from Wang and Microsoft.

Although FileNet announces that it shipped 97 production imaging systems in 1Q 1996 with record revenues of \$66.7 million, the firm's nose gets bloodied by Wall Street as it takes a \$16 million write-off and a first-quarter loss on "lumpy" performance from Saros and an R&D close-out from International Financial Software. Despite these short-term profitability issues, FileNet looks stronger than ever from its product and market strategy perspectives, and the pressure is on IBM and Wang to respond. IDC believes that both will have to go the acquisition route to compete with FileNet's one-stop shopping approach.

There are still four rounds to go, but if we stopped the fight now the winner would be...

The customer. Not only is desktop imaging software literally free, it introduces users to the technical issues and, more importantly, business benefits of ancillary technologies such as production imaging, work flow, groupware and document management. Whether one goes with the toolkit advantages of the Wang-Microsoft approach, the state-of-the-art container design of Lotus, or FileNet's one-stop shopping strategy may ultimately make little difference. Each offers the user an easy point of entry and the ability to leverage an array of technologies.

Post-fight analysis

The early rounds, and many of the slower middle rounds, went to FileNet and Watermark. Watermark had established a significant installed base and a set of reference accounts. FileNet upped the ante by bringing imaging, work flow, document management, COLD software and some form of collaborative computing capability together. In the short term, FileNet took it on the chin with lumpy results from Saros but its overall strategy is compelling.

In the middle rounds, Lotus was bolstered by IBM's purchase, and got more points when IBM added to Lotus' repertoire of moves with ImagePlus. This is a powerful combination for customers automating the enterprise. In addition, IBM can provide imaging at the desktop for free, while

making money from Notes and production class ImagePlus installations. This is where IBM is tops: It has an economic model that works for both the vendor and the customer.

In the later rounds, Wang had the opportunity to set the standard for imaging at the desktop. However, the market shifted and although Wang delivered more than it promised, Windows 95 sales were less than expected. This gave the competition some breathing room and also put pressure on Wang to develop a broader market strategy or run the risk that FileNet and IBM/Lotus will do an end run.

Wang is the only vendor with a public specification and an excellent toolkit downloadable from its home page at no cost. Add to this its installed OPEN/image customer set (55,000 seats and growing) and its acquisitions of Avail and Sigma, and Wang has the underpinnings of a very sound enterprise-wide strategy for imaging.

Technological ins and outs

The ability to use a single viewer to display images from several vendors' image repositories is a key part of an enterprise-wide imaging plan. IDC believes that 80% of the companies that have invested in production imaging have a multivendor imaging environment. Those that can benefit most immediately from having enterprise-wide access to their existing image repositories will be the first to face the issue of standards.

All image viewers support the popular TIFF format. But because annotations to the images are contained in a private tag that is unique to each vendor, in most cases a user on a different platform can display the image but not the associated annotations. Furthermore, the security associated with annotations — i.e., who can make changes and who cannot — is lost. So although current technology allows a degree of interoperability, the industry still has far to go to make enterprise-wide imaging a no-brainer.

In all fairness, Wang has made public its annotation capabilities. The result is that even people who do not use the Microsoft engine can still read and write to the files and read and write the annotation data. At AIIM '96 (the Association for Information and Image Management) in Chicago, an exhibitor demonstrated on a Macintosh its ability "to read and

Imaging Raises the Need for Storage

Imaging is a storage vendor's dream. While the typical data packet might hold about 4KB of information, a scanned page or bit-mapped image, even in a compressed format, may average 50KB. Across the board, imaging files are significantly larger than data files.

In companies that have deployed document management solutions, where tens of thousands of pieces of paper are processed every day, the storage requirements are enormous. To provide the performance that these users require, production imaging vendors have created sophisticated storage management software. By migrating bit-mapped images from optical media to magnetic media to the user workstation through caching schemes, this software allows users to retrieve images much faster.

Storage requirements are growing in every corporation, but particularly in those with imaging applications. Desktop imaging environments now require as much storage as those for production imaging. In a production imaging environment, 100 people may each process 10,000 pieces of paper daily. But 500 employees in a company with imaging at the desktop may create nearly the same volume. And when each page is 50KB, even a 1GB disk will fill up pretty fast.

This is why hierarchical storage management, or HSM, for desktop applications is just as vital as a good repository for production imaging environments. (One reason Wang acquired HSM vendor Avail Systems in 1995 was to co-develop storage management software for Cairo.)

Imaging systems are helping firms conserve physical storage space. The average optical drive can hold the paper equivalent of a dozen file cabinets. But storage technology — whether images are being put on magnetic disk, tape, optical devices or paper — is no substitute for proper records management policies. Such policies depend far more upon the industry than a technology; for instance, storage requirements for the

mutual funds industry are much more stringent than those for the advertising world.

Many companies keep images on magnetic media, then copy these images to a write-once, read-many (WORM) optical drive to create a permanent archival record that cannot be changed. Of course, permanence is relative. Optical vendors are quoting read lifetimes of up to 50 years. But those same drives may have write lives of only 10 to 15 years. If the drive is not written to in that time period, it never will be.

However, when it comes to storage media, companies need not worry about the risk of technological obsolescence. The storage industry has continually done a great job of having backwards compatibility, and there is no reason to think that will change.

Right now, the hot buzzword in storage and retrieval technology is COLD (Computer Output to Laser Disk). COLD server software writes and indexes mainframe reports onto laser disk. COLD client software lets users search the data stored on disk much faster than with microfiche or by sifting through printouts. Now, instead of running thick mainframe reports that most employees need to see only a small part of, many companies put these reports on laser disk and give their users indexing software. Users can call the report up on a PC and read portions of it.

Some companies use COLD as a low-cost, low-risk entry to imaging. IS shops know how much it costs to print mainframe reports and distribute them, so if they can't get management to buy off on imaging, they may take the intermediate step of implementing COLD, which is easy to sell to management because of its clear cost benefits. Once seen as purely an alternative to microfiche, COLD can now handle documents in a company.

So if you're a betting person, rather than deciding which heavyweight will wear the imaging crown, the sure thing might be to put your money on the storage vendors.

Special Advertising Supplement

write the Wang/Microsoft annotations and some WIN 3.1 stuff. So clearly it works," notes Alan Hardy, director of imaging product marketing at Wang. "We are willing to work with other vendors to ensure they can take advantage of what we have done, because customers have to be secure in the knowledge that they are getting the complete file."

Prospective customers need to realize that desktop images should be in one file, to provide capabilities such as portability and mailing. However, in a production imaging environment, you need to separate the image document, so that the annotations are stored on magnetic technology [media] while the image data is on optical, for performance and storage management reasons. In some cases, it makes sense from performance and security perspectives to store the pages separately.

For desktop imaging to become truly viable as an enterprise-wide technology, IDC believes that:

- Imaging must become as ubiquitous as other desktop applications; and
- The gap between desktop imaging and production imaging must be bridged.

The ubiquity of imaging is rapidly being realized through: 1) Wang's imaging in Win95 shipments; 2) Increasing availability of image viewers as plug-ins to Internet browsers; and 3) The bundling of scanners in PCs and keyboards as standard components.

IDC believes that much of the file format and annotation standardization required for broad use of imaging can be best solved by adopting an OLE Store approach. For example, OLE Store image documents could be included in Office 95+ binders, have their properties exposed in an Exchange inbox, or use Microsoft search tools such as Advanced Find to index and retrieve documents based on metadata such as a customer's account number.

Issue #2 — the gap between desktop and production imaging — can be resolved if production image vendors access images through a standard interface. If OLE Store becomes a de facto standard, the application would not need to know that at some point the image file had been one physical file on the hard

drive, or that at another point it had been spread out to different storage locations. In fact, with OLE Store, the application no longer needs to know where the different elements are stored.

One can argue for an alternative approach to an OLE-compatible document format. However, if Microsoft takes the OLE Store concept further by defining a standard annotation model for OLE documents (Excel, Word, PowerPoint and Wang/Microsoft viewer), the entire industry would take a big step up the standardization ladder, making it easier to have desktop imaging as a plug-in technology.

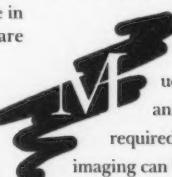

Advice from "the Greatest"

Muhammad Ali's slogan, "Float like a butterfly, sting like a bee" is good advice for the IS community. Desktop imaging requires much pollination to become pervasive in an organization. But you have to ensure that individual projects are not needlessly repetitious. Applications should have a common look and feel, and security and administrative practices must be consistent across the organization.

IS will have to support a wide assortment of input devices, including scanners built into monitors, keyboards and PCs. IS also will be required to support multifunction devices and hand-held input capabilities, as well as the more common standalone scanning capability (double-sided). If input devices are poorly matched to the job at hand, maintaining them will consume large amounts of IS resources.

The technical issues associated with desktop imaging and production imaging differ, but a good enterprise plan takes both into account. IS also has to face three other issues: Does desktop imaging need to be integrated with fax or E-mail to make people more productive? Is it better to use multifunction devices or standalone scanners? How important is color for low-volume scanning?

Ultimately, the productivity impact of imaging on your enterprise will be directly related to answering these questions properly . . . before your users run out and do it on their own. ■

uch of the file format and annotation standardization required for broad use of imaging can be best solved by adopting an OLE Store approach.

Doing It Without Mirrors

Viewpoint

Sam Albert

Surprise! IBM may crash the Internet party

IBM nearly missed the paradigm shift to client/server so you wouldn't expect it to emerge as a strong Internet player. But stranger things have happened. In fact, recent developments indicate that IBM is making a credible run at becoming a seriously wired vendor.

For one thing, the integration of legacy systems with the World Wide Web plays to one of IBM's strengths. American Airlines, for example, is taking existing applications that deliver flight schedules and frequent-flier data and putting that data on the Web for customers. The airline is essentially repackaging the information that resides on its System/390s.

Users are discovering that they can leverage their legacy systems and data rather than create stand-alone Web systems. That's good news for IBM, which likes to point out that close to 70% of the world's business content lives on IBM systems.

Furthermore, with the recent announcement of the company's NetCommerce System, IBM is leading the charge toward the promised land of transaction-based commerce on the Internet.

After watching IBM shake out the electronic commerce offering by selling tickets for the Atlanta Committee for the Olympic Games, mail-order titan L. L. Bean announced that it will use NetCommerce System as the backbone for its online shopping service.

IBM is finally leveraging its vast resources to become a strong 'net player.'

IBM's vaunted research operation is also playing a big role in its electronic commerce plans. For instance, the recently announced Cryptopleo technology is the result of IBM Research moving to commercialize technology licensed from RSA Data Security. Cryptopleo technology secures intellectual content and ensures payment. Big-name companies such as Xerox and America Online are signing up to use Cryptopleo to manage copyrighted material on the Web.

IBM Research has other leading-edge technologies in the pipeline, including scalable server technology that can handle more than 1 million hits per hour with no performance degradation. IBM appears to be able to move its research technologies to the market much more rapidly than just a few years ago.

This is definitely a result of CEO Lou Gerstner's demands for short-term results.

Meanwhile, all IBM's middleware has been reworked for the Internet and all its hardware lines

have been repositioned as high-availability, high-volume network servers. IBM subsidiary Lotus has announced new versions of everything from Notes to SmartSuite that have built-in Web publishing capabilities. IBM's vertical-industry and consulting units are leveraging technology from the company's research and Internet units to create industry services such as AutoNet. AutoNet allows a prospective car buyer to walk in to a showroom, decide on a car, apply for a loan and get approval in five minutes.

These anecdotes are far from conclusive, and Netscape, Microsoft and AT&T will have big roles to play in electronic commerce, too. But the pattern is emerging: Gerstner's declaration and challenge to all IBM employees to make the company a major player in the world of networked computing seems to be taking hold.

Michael Schrage

When is 'good enough' really good enough?

Here's the managerial dilemma. All things being equal, which system would you rather develop and maintain?

System No. 1, which crashes unpredictably once every three weeks and takes more than 80 minutes to reboot?

Or, System No. 2, which crashes twice a day and can be recovered each time in less than three minutes? Other than the downtime, both systems perform superbly.

Now let's complicate the question. A straightforward modification of System No. 1 takes almost 30 days to test and implement. A comparable upgrade for System No. 2 takes less than two weeks.

We're not finished yet. The hard-dollar costs associated with maintaining and modifying System No. 1 are barely two-thirds those of System No. 2. Figuring in the soft dollars, however, makes System No. 1 20% more expensive than System No. 2.

By the way, System No. 2 development projects tend to fail badly unless there is active design participation by users. System No. 1 development projects work fine, with far less user involvement.

So, which system would you choose now?

If you're a gutless, spineless wimp, you give the obvious answer: It depends. Are these air-traffic

**Today,
buggy-but-flexible
software is
better than
flawless-but-rigid
software.**

control systems? Automated teller networks? Stock trading systems? Customer reservation networks? Payroll? Logistics? Just how mission-critical are these systems, anyway?

More important than these questions is the new reality that "the Microsoft mentality" was won in the software design marketplace. Ed

Youdon — a software guru whose observations I admire enough to steal — talks about the "good enough" approach that Microsoft has made its dominant design philosophy.

The issue is no longer whether a package or system delivers the best price and performance; the question is whether the software is "good enough" to do the job within the desired parameters.

This Microsoft packaged-software model has successfully infected the broader enterprise application development community. A bug is less a flaw to be fixed than an irritant to be avoided. It is better to quickly deliver buggy software that is easy to maintain and enhance than it is to deliver a well-designed system that works almost flawlessly but takes man-months to modify.

Design for fast flexibility is thus prized over design for initial performance.

Is this a bad trend? Only a gutless, spineless columnist would answer: It depends. I think this

was an inevitable trend. For once, trend is destiny. Very few systems are truly mission-critical. Even fewer systems avoid numerous modifications in their first 90 days of deployment.

As long as some core functionality is provided, the idealistic notion that excellent systems are made of software that was designed rather than software that was evolved is as dead as "provable correct" programs in the commercial marketplace.

The real development battles are going to revolve around what constitutes the "core functionality" of a system and what are the true costs of modifiability and downtime. Attempts to optimize will consistently give way to efforts to "satisfice" — which is Nobel laureate Herb Simon's felicitous phrase for, ahem, doing work that's "good enough."

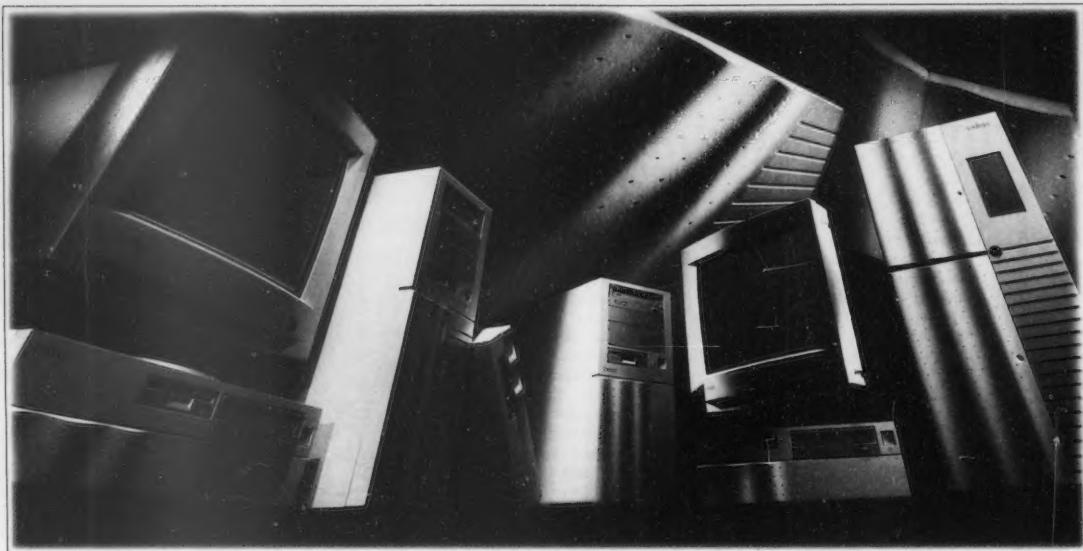

In literature, the cliche is that great stories aren't written, they're rewritten. Similarly, the great software systems aren't designed, they're redesigned. Yes, the core functionality might remain, but nothing so radically transforms a system as interfacing with reality.

That makes modifiability and flexibility the keys to reliability and integrity — not the other way around.

Schrage is a research associate at the MIT Media Lab and author of *No More Teams!* His Internet address is schrage@media.mit.edu.

The Microsoft model of software development has infected corporate projects.

Everything you're looking for in PCs.

From a place you probably didn't look.

You might not think of Unisys as a place to find state-of-the-art PCs for your company. But

all that's changed with *Aquanta*™ PCs and servers. This new product line matches—and even surpasses—the best the PC world has to offer.

Aquanta means quality, with rigorous testing that ensures mainframe-class dependability for mission-critical applications.

Aquanta means performance, with one of the industry's most powerful and scalable product lines—including multiprocessor Pentium and

Pentium Pro models, SMP servers and fault-resilient servers.

Aquanta means compatibility, with support for all major operating systems and networks to simplify client/server computing.

Aquanta means support, through Unisys worldwide experience implementing technology across departments, companies and countries.

And finally, *Aquanta* means this: While we may not be the first place you look for PCs, we just might be the last.

Dell, Sharp move to front in multimedia notebook parade

By Stewart Deck

A quartet of multimedia laptops from Sharp Electronics Corp. and Dell Computer Corp. promises to bring a symphony of sights and sounds to mobile users.

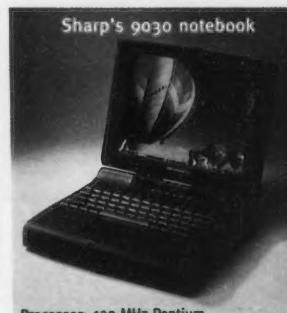

Two new models from Sharp, the PC-9000 and PC-9030, feature built-in, six-speed CD-ROM drives and Sharp's Super High Aperture LCD screens. Dell's Latitude LM P-133ST and LM P-100SD include built-in, four-speed drives and a new graphics chip set designed to process video and graphics quickly.

Notebook users were glad to see Dell finally include a CD-ROM drive in its mobile products. "That's been a weakness in their product line. In our business, that's a very important feature," said Bruce Benham, vice president of information technology at real estate firm Re/Max International, Inc. in Englewood, Colo.

Hot technology

Benham said Re/Max has used a variety of Dell notebooks. But when the company needed to make multimedia presentations and run a recruiting application on CD-ROM, it looked to Toshiba America Information Systems, Inc. for laptops with onboard multimedia capabilities. Now, Benham said, Re/Max will look closely at the new Dell models as another option.

Dell's new laptops are also noteworthy for their graphics chip set from NeoMagic Corp., said Gerry Purdy, editor in chief of "Mobile Letter," a newsletter in Mountain

Processor: 120-MHz Pentium
Weight: 7.3 pounds

IBM's 64-bit boxes missing from race

By Craig Stedman

After Hewlett-Packard Co.'s introduction last week of its first 64-bit hardware, IBM stands alone: It is the only one of the major Unix vendors without a 64-bit chip.

PowerPC development delays have left IBM at the end of the 64-bit parade. It isn't expected to field an all-new processor until next year, and users and analysts said that leaves IBM's RS/6000 systems vulnerable to being outgassed by more up-to-date machines from rival vendors.

"As much as I'm a big IBM fan, I think they are at a disadvantage right now," said David Pensak, a senior research fellow at DuPont Co. in Wilmington, Del.

Pensak is in charge of computer science research at DuPont and primarily uses RS/6000s and Sun Microsystems.

IBM's SPARC-based systems.

For workstations and servers, the current RS/6000 architecture "is a little long in the tooth," Pensak said. The 32-bit PowerPC and Power2 chips used by IBM "just don't appear to be real competitive right now," although IBM does tend to do a better job of hitting its benchmark numbers in real-world applications than some other vendors do, he said.

IBM's lack of 64-bit technology isn't a big deal in and of itself, observers said. Sixty-four-bit applications aren't close to being widespread, and vendors such as Sun and HP are shipping only hardware for now. They won't have full 64-bit operating systems ready until late next year or even 1998.

But from a raw performance standpoint, IBM's 32-bit CPUs have trouble keeping pace with the newer processors that its competitors have successfully developed and brought to market.

Briefs**Mainframe to PC**

For System/390 users looking to off-load some applications to a PC server, IBM plans to upgrade the original version of its mainframe-PS/2 hybrid introduced a year ago. The P/390, also called the PC Server 500 System/390, runs OS/2 and has an embedded board-level System/390 processor.

HP speeds up

Hewlett-Packard Co. introduced higher-performance versions of the low-end D-class

servers in its HP 9000 line. The D260 and D360 run up to 60% faster than earlier models because of expanded cache memories that have been added to their PA-7200 processors, HP officials said. Pricing starts at \$33,590.

Videophone basics

Intel Corp. wants users to phone home — and to send a picture. Intel in Santa Clara, Calif., plans to ship a version of its Proshare videoconferencing product that uses standard telephone lines. It will use a 133-MHz Pentium PC and a modem that adds video capabilities to a standard phone.

IBM's 64-bit boxes miss race

CONTINUED FROM PAGE 43

ket. "IBM is finding themselves outmarketed by more nimble design houses," said Rich Partridge, an analyst at D. H. Brown Associates, Inc. in Port Chester, N.Y. "Everyone else has new chips, and IBM is the one that can't figure out how to find its way out of a paper bag."

The 64-bit PowerPC 620 was supposed to be ready late last year, but it had to be redesigned because of poor performance.

On the server side, IBM has been hurt even more by a year-long delay in adding the 32-bit PowerPC 604 to its multiprocessor RS/6000s. Those systems still use the original 601 chip.

Don Johnson, manager of product marketing for enterprise servers and clusters at IBM, said the

multiprocessors will finally get the 604 upgrade this summer, which should increase per-CPU performance by 30%.

IBM expects to ship 64-bit servers in the second half of next year. The servers will most likely use the PowerPC AS chip developed by IBM's AS/400 division. "Clearly, we want to have 64-bit technology, but I think you'll see us catch up dramatically" with the addition of the 604, Johnson said.

IBM made small market share gains in workstations and servers last year, according to separate surveys by Dataquest in San Jose, Calif., and Aberdeen Group, Inc. in Boston.

But now that HP and Sun have 64-bit hardware, "the pressure [on IBM] becomes much more real," said Andy Feit, an analyst at Dataquest.

New Products

Optical Access International has announced CD/Enterprise Server 6400, a 64-drive rack-mount server that provides access to all drives in one cabinet.

According to the Woburn, Mass., company, CD/Enterprise Server 6400 provides more than 42G bytes of data in a single configuration and was designed for enterprise-wide environments that require instant access to applications and data on CD-ROMs.

The server systems support DOS, Windows, Windows NT, OS/2 and Macintosh workstations and can directly access the rack-mount servers on networks from Novell, Inc., Microsoft Corp., IBM, Banyan Systems, Inc. and Apple Computer, Inc.

Each server system is configured and managed from a control panel.

Pricing for CD/Enterprise Server 6400 starts at \$18,595. More information is available at the company's home page at www.oai.com.

K460-XP	128M bytes	2G bytes	20-in. color	3-D	\$112,245

Hewlett-Packard Co. joined the 64-bit computing crowd last week by introducing five high-end graphics workstations based on its PA-8000 microprocessor. Prices for the new HP Visualize systems start at close to \$25,000, as expected [CW, June 3]. HP has "been a little bit quiet in the technical computing market for awhile," admitted Richard Watts, vice president and general manager of the Palo Alto, Calif., company's computer systems unit. But the PA-8000 puts HP back in the upper echelon of performance on Standard Performance Evaluation Corp. benchmarks. Volume shipments of the workstations are scheduled to start next month. HP's Unix servers will start getting the 64-bit treatment in September, officials said. — Craig Stedman

cally configures itself as a Novell, Inc. NetWare or Network File System server.

CD-Express Connect doesn't require dedicated servers, special drives or administrative setup. It is available in a seven-high CD-ROM tower or as an upgrade device for Micro Design CD-ROM drives.

Pricing for CD-Express Connect starts at \$995.

► *Micro Design International, Inc.* (407) 677-8333

Micro Design International, Inc. has announced CD-Express Connect, an advanced CD-ROM server.

According to the Winter Park, Fla., company, CD-Express Connect acts as a mini CD-ROM server that allows simplified network sharing of CD-ROM data without drawing resources from existing servers.

It can be installed anywhere on an Ethernet LAN, and it automati-

seven drive bays and can support up to 30G bytes of capacity.

RAID Array 310 is supported on Digital Unix, Sun Microsystems, Inc. Sun Solaris, and Microsoft Corp. Windows NT. Pricing starts at \$10,000. More information is available at Digital's home page at www.storage.digital.com.

PC technology. Power behind it.

In the last year alone, millions of PowerPC™ microprocessors were designed into new products, from automobiles to high-end computer systems. In fact, they've already outsold all other major RISC-based desktop microprocessors combined.

And with a 200MHz version (the first ever for volume desktop), the Apple, IBM and Motorola (AIM) alliance is continuing its high-performance leadership. The AIM Alliance is also developing the PowerPC Platform™ specification for a common hardware reference platform, which will allow any user to run the Windows NT™, Mac™ OS, AIX® and Solaris™ operating systems—all from a single computer.

Of course, the AIM Alliance members aren't just counting on PowerPC technology, they're building a host of products around it. Apple's entire product line is built on PowerPC Architecture.™ IBM has created several lines of next-generation servers, including

the AS/400° and RISC System/6000°, on PowerPC technology.

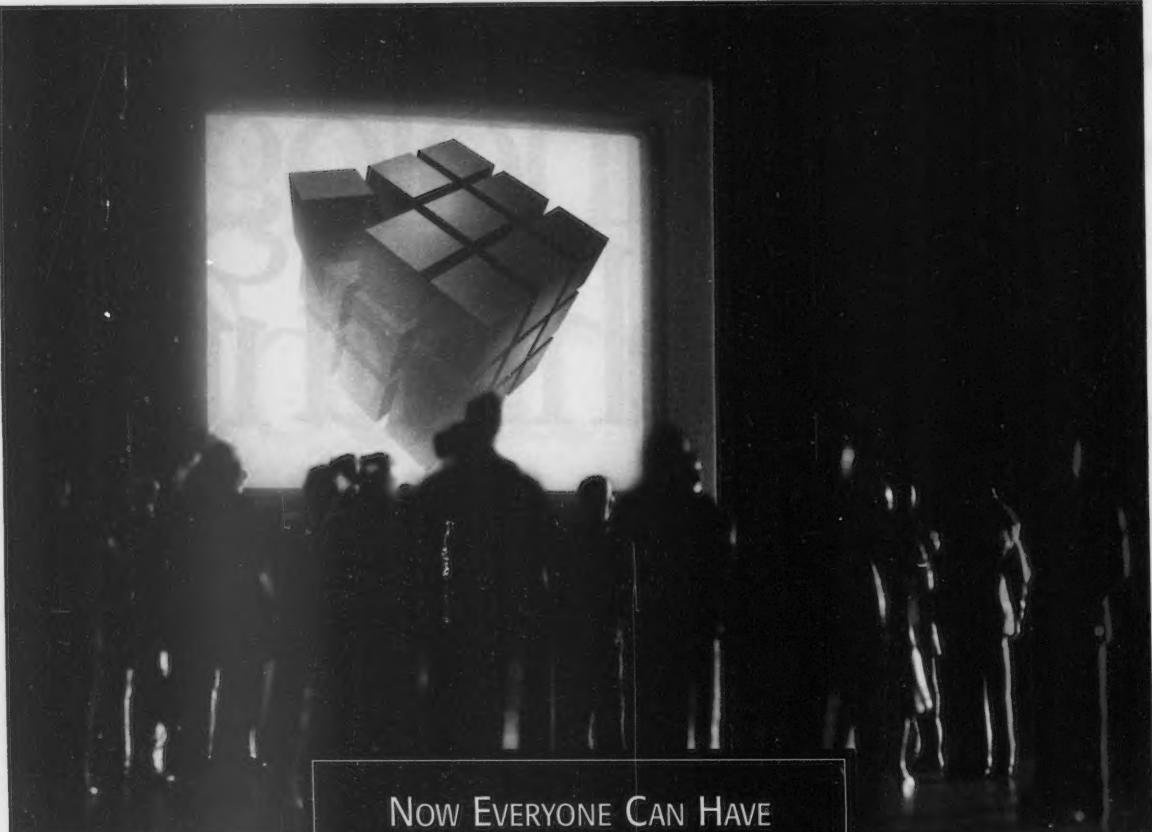

And Motorola offers an impressive range of PowerPC microprocessor-based boards and systems, from personal workstations to high-end servers. Plus with our newly opened, billion-dollar PowerPC microprocessor fabrication facility, our commitment is now stronger than ever.

But the people who developed PowerPC technology aren't the only ones who count on it. Companies like Ford, Xerox, Honeywell and others are designing PowerPC Architecture into their products. Creating the momentum that's changing the future of technology forever. Call 1-800-845-MOTO, ext. CW, or visit <http://www.mot.com/PowerPC/> to find out more about PowerPC Architecture. And the power behind it.

Software

Mainframes build muscle by adding Windows NT to arsenal

Big iron retrofit

By Michael Goldberg

In the past year, IBM's System/390 leaders have held their own kind of glasnost, bringing an openness to the mainframe world through the adoption of Unix operating system traits.

IBM hopes to continue its breakout from the "Big Iron Bastille" with a plan to port Windows application programming interfaces (API) to the OS/390 operating system.

IBM recently announced it is joining with Bristol Technology, Inc. in Ridgefield, Conn., to port Bristol's Wind/U application development software to OS/390. With that technology, programs that use the Win32 API set and are written for Microsoft Corp.'s Windows NT in languages such as C and C++ can be ported to mainframes.

Wind/U recompiles programs designed to run on Windows or Windows NT by linking Win32 APIs to Unix APIs and translating the source code into a binary format that can be executed on Unix servers, said Ken Blackwell, chief technical officer at Bristol. Because the OS/390 supports many Unix APIs, porting a recompiled NT application to the 390 will be comparable to Bristol's ports to a Unix variant such as AIX, he said.

Officials at IBM and Bristol said they hope Wind/U for OS/390 will be made available to software developers by year's end. The first NT applications ported to the mainframe won't be ready until early next year.

It is still undetermined how the Wind/U capabilities will be priced, packaged and sold to System/390 users, IBM officials said.

The move marks IBM's recognition that "Windows is a fact" for many mainframe users, said Charles Lickel, vice president of System/390 software development.

"I need to support the preva-

lent interfaces like Windows NT and Windows 95. [Not doing that] would be stepping back, in my mind, five years or more to the old mainframe mentality of, 'We know what all the important interfaces are. Here they are. Use them.' That won't work today," Lickel said.

Though some mainframe users will want to use the Wind/U software for in-house projects, observers said they expect the IBM/Bristol deal to initially play to independent software vendors.

One large user encouraging IBM to build mainframe bridges to NT is NatWest Bank in London. It has started using Wind/U to link its NT-based communications and business applications to its System/390 machines without losing any functionality, said Ashleigh Tanner, a technical consultant.

Rich Dill, a member of the research and development team at Powersoft Corp. in Concord, Mass., said the IBM/Bristol efforts mean his firm can port Powersoft's PowerBuilder application development software to the System/390. This will let users build

applications on the low-cost hardware platforms that NT supports before testing them on the mainframe, he said.

With the embrace of Unix and this deal with Bristol, IBM has given the OS/390 "a life of its own," said John Young, an analyst at The Clipper Group,

Inc. in Wellesley, Mass.

"The System/390 has learned a little better than others that if you don't ride with the latest storm, you get pretty battered. They were three or four years late getting there in Unix. Now they're ahead of the curve [with NT]," he said.

A groggy start for Java products

By Lisa Picarille

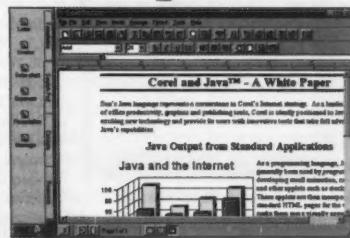

Personal productivity software users still have plenty of time to sort through the hype that surrounds the Java programming language.

Though Java-enhanced versions of these products are apparently on the way, most developers have yet to announce products based on the language.

Part of the delay is due to Java — which allows applications on a network to be accessed from any desktop operating system — being primarily focused on the network, not the desktop.

"Users don't gain anything unless the applications are completely rearchitected," said Jeff Tarter, editor of "Softletter," an industry newsletter in Watertown, Mass. "Java implies a client/server architecture, and almost all of the existing PC applications are designed for the desktop."

The promise of platform-independent applica-

Corel is one of the few software developers to announce plans for a Java-based suite of applications

tions and reusable code has Internet software developers jumping on Java, but some users of productivity software aren't quite as juiced.

"It's still unclear what benefits Java brings for our Java products, page 52

Links allow easier job scheduling

By Bob Francis

Information systems staffers will be able to coordinate job scheduling across multiple applications — a key feature in managing client/server applications.

That will let companies cut down on the number of job schedulers they must buy and learn. Each application traditionally has come with its own scheduling system, but now vendors are joining forces to ease this problem.

For example, Platinum Technology, Inc. in Oakbrook Terrace, Ill., offers its AutoSys job scheduler with adapters that link schedulers built in to SAP AG's R/3 and Oracle Corp.'s Oracle Applications. Platinum Technology is also developing adapters for PeopleSoft, Inc.'s Human Resource Management System and Legato Systems, Inc.'s NetWorker storage management software. And Unison Software, Inc. in Santa Clara, Calif., has delivered SAP links to its Maestro scheduling product that runs on Unix, Windows NT and Hewlett-Packard Co.'s MPE operating systems.

Job scheduling, page 52

BUILDERS

"WHEN IT WAS TIME TO INTEGRATE
43 DATABASES INTO A WAREHOUSE...
IT WAS TIME TO CALL THE BUILDERS."

PJ Matarese, Senior Analyst, Philips Semiconductors

When the competition heats up in the semiconductor business, you accurately match your manufacturing mix, customer demand and profitability or it's time to "cash in the chips." That's why Philips Semiconductors, one of the nation's largest silicon chip manufacturers, decided it needed a faster, more efficient system for key managers to analyze the information stored in the corporation's 40 operational databases. What was the solution? A Data Warehouse built with the help of EDA middleware, FOCUS Six reporting and analysis tools, and an experienced team of application experts...all from Information Builders.

Today, worldwide sales data from three continents is transmitted via TCP/IP network to Philips' data center in Sunnyvale, California. It's then loaded to a mainframe Data Warehouse using EDA middleware technology for data access

and migration. Managers and business analysts in Marketing, Sales and Finance access and analyze the warehouse data with FOCUS Six for Windows EIS Edition, and use FOCUS Six Reporter to create ad hoc reports. The result...business managers keep manufacturing in sync with market demand through better forecasting; while IS managers spend their time developing other strategic systems instead of generating 300 pounds of custom reports each month.

Philips Semiconductors is just one of thousands of examples of how Information Builders has partnered with the world's leading corporations to build enterprise-level reporting and analysis systems. Find out how Information Builders' technology and services can help your organization. Call us at 800-969-INFO.

Software

Your data ought to be in pictures

By Dan Richman

Businesspeople say a picture is worth 10,000 words when analyzing data, and a relatively new category of software is proving their point.

Visualization tools color-code groups or clusters within data, said Jay-Louis Weldon, a senior consultant at SHL, Inc. in Ottawa. They can also graphically display trends and patterns.

Such pictures make big answer sets understandable not only at the end of an analysis, but also during it, which provides clues for the next step in an inquiry.

Often the product of university and commercial research labs, visualization tools are most popular in finance and trading, but other businesses have also started to use them, Weldon said. Vendors that once supported only scientific visualization are entering the business marketplace. At least 10 vendors have put products onto the market — several within the past two years (see chart).

NationsBank, Inc., a banking company in Charlotte, N.C., plans to use the Discovery for Developers

"When the data is so multidimensional that you'd need 400 graphs to show it, you have two choices: You can use statistical software to pare down the data first, or you can use a multidimensional display tool. Businesspeople prefer the latter."

The tools are a response to the increasingly ambitious analyses sought by users and the ever-increasing size of data warehouses. From those vast reservoirs, conventional query tools elicit textual or tabular responses.

That's fine when the queries are simple. Even the simple graphics in most query tools can display the results of queries such as "Which regions of the U.S. had the highest sales of Product X last quarter?"

But when queries become more complex, specialized tools are needed. The query "Which regions of the U.S. had the highest sales of Products X, Y and Z for the past eight quarters, by sales channel, payment method and salesperson?" simply evokes too much data for many tools to display helpfully.

Java products

CONTINUED FROM PAGE 49

company," said Gary Wilkerson, supervisor of End User Services at Kaiser Permanente Health Plan, Inc. in Atlanta. "There are too many questions about what works with what and how we can maintain our previous investments."

Although a slew of emerging Internet and World Wide Web developers — as well as tool and language companies — have announced a variety of Java-based products, to date only Corel Corp. and Just Systems, a large Japanese software maker, have announced plans for Java-based suites of applications.

At last month's JavaOne conference, Corel demonstrated a Java-based version of its Corel Office suite.

Java 5,000

More than 5,000 commercial and corporate developers last month attended JavaOne, JavaSoft's conference in San Francisco.

But "by the end of the year, we will see a number of beta versions of productivity applications written in Java," said David Spenhoff, director of product marketing at Cupertino, Calif.-based JavaSoft, a division of Sun Microsystems, Inc. Spenhoff declined to provide any details.

Lotus Development Corp. was among those recently announcing support for JavaSoft's new component integration architecture, code-named Java Beans, but Lotus still hasn't fleshed out plans for Java in its desktop applications.

Microsoft Corp. has said it will support Java in its Internet Explorer and in Windows. But in a recent interview with Computerworld editors, Chairman Bill Gates wouldn't comment specifically on how Microsoft's best-selling Office suite of applications would support Java.

And one user said not having to worry about that would be a huge relief.

"If everything Java promises is true, then running Java applications over an intranet becomes a boon for us," said one information systems manager at a large East Coast manufacturing firm who requested anonymity. "That should save us a considerable amount of money and hopefully a lot of headaches, provided that the major software developers have Java versions of their products."

Job scheduling made easier

CONTINUED FROM PAGE 49

Client/server applications such as SAP and Oracle come with their own job schedulers, but they only work with their own applications and sometimes don't scale as well as other job schedulers.

"We were looking for one corporate scheduler to use instead of having several for a wide variety of applications and systems," said Mike Mueller, former computing consultant at Wisconsin Electric Co. in Milwaukee. "We wanted to schedule jobs on both our legacy systems and also our new Unix

applications, so we began to work on linking AutoSys with our applications," he said.

When Platinum Technology heard about Mueller's work, it sent programmers to work with Wisconsin Electric's IS group on the product.

In Platinum Technology's implementation, which uses the applications' internal job scheduler, AutoSys becomes the central point of control. The AutoSys console runs on Unix and Windows NT and is also integrated with Zeke, Platinum Technology's job scheduler for MVS.

Schedule changes

Platinum Technology is integrating its AutoSys job scheduler with the following client/server applications:

- SAP AG's R/3
- Oracle's Oracle Applications

- PeopleSoft's Human Resource Management System
- Legato's NetWorker

BUILDERS

WE
F

HOW DO YOU BUILD A MANAGED QUERY
ENVIRONMENT THAT STAYS MANAGEABLE?
CALL THE BUILDERS.

ALL THINGS MUST CHANGE

Today's latest tools for creating Managed Query Environments (MQE) make life very manageable... for the users. But what about the MQE Administrator? You know, the guy or group who has to define your business views and build your queries so all you do is point, click, and drag. What happens if some or all of your 200 business analysts need new or different views of your data? What happens if accounting methods change, or quotas are calculated differently? How does the MQE administrator keep your Managed Query Environment from becoming an unmanageable nightmare? The answer... FOCUS Six Managed Reporter.

INTRODUCING THE MANAGEABLE MQE

FOCUS Six Managed Reporter is the only MQE toolset that shields the MQE Administrator as well as the end user from the complexities of SQL. FOCUS was invented for reporting. Even

the most complex queries with conditional fields, rankings, "if-then-else logic," multi-dimensional analysis... the kinds of queries that could take even the most experienced programmers hours to build in SQL, take only a few seconds in FOCUS. And that means a managed query environment that's more responsive to change and much easier to maintain. And only FOCUS Six Managed Reporter offers a three-tier client/server architecture that dynamically partitions all queries. That means your network stays manageable too, because all aggregation takes place on your server. Only information is sent down to the PC... not millions of rows of data.

CALL THE BUILDERS

For more information of FOCUS Six Managed Reporter and our complete suite of three-tier client/server reporting systems, call "The Builders" at 800-969-INFO.

Wireless networks help police take a bite out of crime.⁵⁸

The Enterprise Network

Braced for Internet impact

Sprint's pilot program tests firewall, network performance and delivery

By Patrick Dryden

Sapped networks. Clogged gateways. Breached security. Overloaded support structure.

That's what network planners and managers at Sprint Corp. seek to prevent through a pilot project that has provided some 2,000 employees with Internet access for the past year.

Sprint didn't publicize Internet availability so it could control demand and lessen the impact on its existing in-house network and information services.

Eventually, Sprint may have to support nearly 60,000 users — 48,000 Sprint employees and others in subsidiaries and affiliates.

"Wide-open request for service would crush all our support system, so the pilot let us find holes instead of gaping wounds," said Tim Mathias, senior network design engineer at Sprint in Westwood, Kan.

Program expanded

Sprint started small, adding three groups of 50 users to test the firewall and watch the performance of the internal network. But after 60 days, evaluators determined they needed more than 500 users to adequately stress the Internet gateway and the internal network.

Then Sprint expanded the pilot program to test its order and delivery process as well.

Anyone who needed Internet access badly enough and asked often enough received an authorization form, then support.

Sprint's planners and informa-

tion systems department learned valuable lessons from the pilot program, which is expected to end next month.

New users initially create very high load on the network and gateway as they explore Internet resources.

"We see a spike in usage for two to three weeks, then they settle down to do their jobs," Mathias said.

Objective: Enable Internet access for 60,000 users

Obstacles encountered after 2,000-user pilot project:

- HIGH INITIAL USAGE — Users heavily explore the 'net for up to three weeks.

- BANDWIDTH DEMAND — Must ensure adequate network and gateway capacity.

- RELIABILITY — Internet performance is out of IS control.

Fortunately, Sprint can quickly evaluate and adapt its internal network to accommodate such bandwidth demand, Mathias said.

But this usage pattern warns planners to stagger the implementation of service.

Sprint's IS department already has streamlined its service-ordering system in order to assign TCP/IP addresses and install

browser and other access software during the Internet rollout.

Upgrades are under way to boost the performance of the gateway platform, and evaluators are configuring the gateway software to balance security, capacity and manageability.

Running the pilot project with a sufficient number of users was essential in determining how many sessions each gateway configuration could support comfortably, Mathias said.

"Translating tests and product reviews to a real environment is difficult because a lot depends on how you implement security," he said.

Lack of control

IS can meet the challenge of ensuring adequate internal bandwidth for Internet users but not reliability.

"The Internet is the only network service that IS doesn't control from end to end," Mathias said.

That's a common complaint, but unlike other corporations, Sprint is blessed with adequate network capacity to start, said Frank Dzubek, president of Washington-based consultancy Communications Network Architects, Inc.

"This sounds like a client/server rollout, instead of the typical anarchy that results when everyone brings in his own browser," Dzubek said. "But they better beef up their help desk to provide assistance when the new users wonder what to do."

Token Ring users move to Ethernet

By Bob Wallace

Some longtime Token Ring users are moving to Ethernet switching to save money and boost network performance.

These users are tired of IBM's pricey Token Ring adapter cards and the slow emergence of Token Ring switching. So instead of making the move to "True Blue" Token Ring switching, they are going with tried-and-true Ethernet.

"We were an IBM shop with 300 to 400 Micro Channel PCs but wanted to open up to alternative vendors such as Dell, Gateway and Micron," said Ian Steward, director of information systems at Fish & Richardson, a Boston law firm. "The \$100 Ethernet adapters looked much better than \$300 to \$400 Token Ring adapters."

Steward said he was also looking for a way to support what he thought would be a very popular imaging application that would require more bandwidth than a shared Token Ring network could provide. The firm upgraded to Ethernet switching from 3Com Corp.

Token Ring switching has come along slower than Ethernet switching for a reason. The 10M bit/sec. shared Ethernet LANs run out of capacity before 16M bit/sec. Token Rings. So Ethernet users ran out of bandwidth first, and that sparked the rapid emergence of Ethernet switching (see chart, page 58).

Users who make the move go from sharing 16M bit/sec. on a Token Ring LAN with many end users to having a dedicated 10M bit/sec. personal bandwidth pipe to each desktop with Ethernet switches.

Analysts said shared Token Ring LANs are becoming an endangered species.

"Token Ring is on the way out, as [Token Ring] Token Ring, page 58

This free booklet helps you make the right connections.

Unix can be your best platform for branch office and departmental computing. The challenge is: linking these distributed Unix sites to your mission-critical IBM host applications and data.

Our free Solutions Guide helps you understand your Unix-to-host connectivity alternatives. It covers:

- All IBM emulations — 3270 and TN3270, 5250 and TN5250
- Networking options including SNA/SDLC, TCP/IP, X.25, and Token-Ring
- SNA host access for LAN-based Windows and Unix clients via Unix servers
- API tools including HLLAPI, APPC/CPI-C, and LUA/LU 0

- RJE (3770 SNA, 3780 BSC), NetView DM, and other file transfer methods

Police cruising with wireless nets

By Mindy Blodgett

When the police department in Groton, Conn., pioneered the use of a wireless network to communicate with officers in their cruisers in late 1994, analysts predicted that police forces nationwide would swiftly follow suit.

It has taken more than a year, but the Groton experiment with a Cellular Digital

Balch of the Los Altos, Calif., police department, which is launching one of the two new CDPD systems in that state.

With CDPD systems in place, police can pull over suspects and check registrations without using their radios, which can be easily scanned.

In recent months, Bell Atlantic Nynex Mobile has signed on the police forces in Groton, Philadelphia and Bridgewater, N.J., and the Delaware State Police. GTE Mobilnet, Inc. and Software Corporation of America (SCA) have snagged the Gilroy and Los Altos departments, the first two programs in California. Mesa, Ariz., police have used CDPD-enabled IBM ThinkPads for the past eight months.

"It's definitely become a bit of a driver for CDPD," said Nick Zemlachenco, regional director for data at Bell Atlantic. "For instance, we are installing CDPD in Delaware, where we might not have for a few years, because the state police need statewide coverage. Now the network will be there for other users."

While CDPD carriers wouldn't say exactly how much of the user base is comprised of public safety users, they did say police departments make up a giant chunk of current CDPD deployments.

A key attraction to CDPD is its relatively low cost of installation. Private radio networks can cost \$500,000 or more, according to police. In Gilroy, for instance, the

CDPD implementation will cost \$223,000. It includes 30 ruggedized laptops, 22 of which will be installed in cruisers, as well as SCA's Premier MDT (mobile data terminal) software, which will allow private messaging between vehicles.

Inexpensive airtime

In a bid to attract the law enforcement market, CDPD carriers are keeping airtime costs relatively low. For instance, Bell Atlantic will charge its police users about \$2 to \$3 per day per cruiser, Zemlachenco said. CDPD rates normally differ by region, and corporate users can choose from several price plans based on the number of users

and the volume of use.

Sgt. Earle Lloyd, a spokesman for the Mesa police department, said the systems are a time-saver during investigations.

"Just this morning, we had a homicide in which the victim was found in a car," Lloyd said when interviewed recently. "The investigators were able to check on the history of the victim and the car immediately, without having to call the dispatcher to do it."

Balch said interest in such a system was fueled in California by the death of 12-year-old Polly Klaas, a young girl who was murdered after her alleged killer — who had an extensive record — was stopped in his car by police, then released.

Sgt. Earle Lloyd of the Mesa, Ariz., police department said the CDPD-enabled IBM ThinkPads save time during investigations

Packet Data (CDPD) system did catch on big with police departments, which in the past few months have signed on to CDPD networks in force.

"It increases an officer's safety and is an invaluable crime-fighting aid by giving instant access to criminal history databases and other information," said Capt. Clifford

COMPUTERWORLD JUNE 10, 1996 (www.computerworld.com)

Token Ring users move to Ethernet

CONTINUED FROM PAGE 55

adapter cards sales are flat," said Trudy Barker, director and principal analyst at Dataquest, a San Jose, Calif., consulting and research firm. "Token Ring switching can turbocharge these networks, but many users are moving to Ethernet switching and Fast Ethernet instead."

That's certainly the case at First Union National Bank Corp. in Charlotte, N.C.

"We've given over 3,000 end users switched Ethernet instead of shared Token Ring already — with 1,500 more due soon," said Fred Cory, assistant vice president and consulting networks systems engineer. Cory and Tod Price, a consulting network systems engineer, calculated they save approximately \$400 per seat by going with Ethernet switching over shared Token Ring in new facilities.

Cory, who chose switches from Cisco

Systems, Inc., said some PC vendors such as Compaq Computer Corp. ship their PCs with Ethernet adapters.

Mark Kudel took a hard look at upgrading the Token Ring network at R. R. Donnelley & Sons Co.'s corporate headquarters in Chicago and found that moving to Ethernet switching instead would cost \$600,000 to \$800,000 less.

Easy decision

"It was really a no-brainer for us," said Kudel, R. R. Donnelley's strategic network architect. "We didn't want to risk anything on the not-yet technology of Token Ring switching." And like Steward, Kudel liked the idea of going with cheaper Ethernet adapter cards.

R. R. Donnelley needed the bandwidth of Ethernet switching too as the company's use of client/server-based human resources, financial systems, office productivity and data warehousing applications soared and outages occurred.

New Products

Protec Microsystems, Inc. has announced NetAdvantage PSM-Hub.

According to the Montreal company, NetAdvantage PSM-Hub is a 16-port Ethernet hub and five-port multiprotocol print server unit for TCP/IP, Novell, Inc.'s NetWare and Microsoft Corp. Windows 95, Windows NT and Windows for Workgroups. It supports 10Base-2, 10Base-5 and 10Base-T. The product features individual port status and activity displays, a switchable port for cascading hubs and thick and thin Ethernet support.

NetAdvantage PSM-Hub includes auto-

matic features for port link integrity testing, polarity correction and port partitioning and reconnection. Pricing starts at \$995.

*Superior automated
back-up and restore
from the world's
largest manufacturer
of 8mm
tape libraries.*

Some things are hard to believe. Like disasters and total data loss. But these things happen; there's documented proof. If it ever happens to you, an Exabyte 8mm tape library will restore your data faster than you can say "mission critical."

Exabyte libraries employ sophisticated technology, like intelligent robotics and multiple drives working in parallel, to ensure fully automated back-up and rapid file retrieval. Our modular, field-replaceable-unit design yields maximum uptime. And when equipped with our new Mammoth drive, a single library can store from 140 gigabytes up to 3.2 terabytes of data at a transfer rate up to 86.4 GB/hr.*

As the leader in 8mm technology, we've designed our libraries to be compatible with 60 software applications across all client/server platforms. And Exabyte is the only manufacturer to design all the components in a family of libraries; these include drives, media and robotics. Our tape library expertise eases integration, assures a clear upgrade path, and delivers superior performance, all at just pennies per megabyte.

Capacity, performance, reliability, and fully automated back-up: It all adds up to peace of mind that's, well, unbelievable.

The Enterprise Network

For many companies, MOM knows best

By Tim Ouellette

When you were a child, Mom could always solve your problems.

Many business users think Mom can solve their problems, too.

These users are looking at message-oriented middleware (MOM) as a way to ensure that data flows among disparate applications. This, in turn, can save time and money in getting the right information to the right people.

MOM is a way for applications to send a data message to an application running in a completely different computing environment.

The messages that middleware carries can include a client's request for data from a legacy system, updates to client applications from a database receiving an outside data feed and updates to central databases based on input to business applications at numerous branch offices. The applications adopt client and server roles as needed.

MOM processes all these messages by placing them in queues that can be accessed by the receiving application when ready. In this way, the message delivery isn't tied to whether the receiving system is up and running, and the application sending the message doesn't have to wait for a response.

The middleware replaces the code that would need to be written to make each application speak with one another.

MOM isn't a single parent in the middleware family (see chart above). There are many forms of

middleware available, but analysts and users see MOM as more open and reliable than the others.

MOM also is an effective way for users to handle future changes in technology, with minimal infrastructure changes, because the applications involved don't need to be tightly tied together.

That is important to users who want little impact on their current architecture.

"We didn't want our applications people to code new protocols into their applications," said Ron Berry, a technical risk analyst at Barnett Banks, Inc. in Jacksonville, Fla.

Instead, IBM's MQSeries middleware handles the interaction among applications, with only basic configuration effort required from programmers. In other words, MQSeries became the common interface among the applications.

Now users get the information they need without having to take time to hunt through various company computer systems. For example, since installing MQSeries, users running Notes can automatically receive data from a mainframe system.

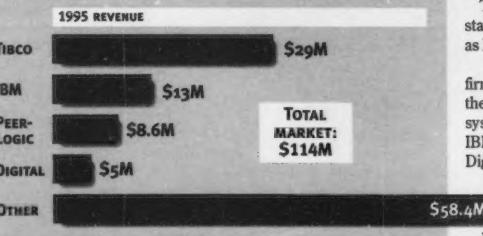

And Barnett Banks has seen its loan-processing procedure dwindle from as much as five days of paperwork to a matter of hours, Berry said, because MQSeries automatically messages the relevant information between the client loan applications and the back-end databases.

Programmers at Lane Furniture in Alta Vista, Va., use Software AG's Entire middleware to write references inside their applications to any database the company runs, said Tom Thompson,

MOM's favorites

Leading message-oriented middleware (MOM) vendors:

Source: International Data Corp., Framingham, Mass.

In the middle of things

Variations of middleware, which as a market could reach \$3 billion by 2000

Message-oriented middleware:

Uses messages to carry data among applications.
Doesn't require a direct connection.
Guarantees delivery.

Remote procedure calls:

Communicate only between processes.

Database connectivity products:

Link a number of vendors' databases.

Allow software objects to communicate over different protocols and hardware platforms. Provide multithreading and directory services.

Distributed transaction processing monitors:

Monitor application transactions in a multiplatform environment.

Source: Ovum Ltd., UK

Lane's manager of information systems. He said the middleware helps keep the master files on the mainframe in sync with the ever-changing files around the company—all in real time.

Streamlined access

Users can also access a mix of computer-aided design files on a Unix system, PC files and mainframe files without having to move to each system.

"Without [middleware], we would have to do batch files to transfer data back and forth," Thompson said.

Other users say messaging provides more guarantees that the data will get to the right place, regardless of whether the receiving server goes down. Blue Cross/Blue Shield of Oregon turned to MOM from PeerLogic, Inc. because Kip Stevenson, manager of systems development, said the technology was more reliable than other choices.

The company checked into object request brokers and remote procedure calls in addition to MOM. "We felt messaging was a little more mature," he said.

The MOM market got its jump-start in financial institutions such as Barnett.

Just a few years ago, many firms were tired of maintaining their homebrewed middleware systems, and companies such as IBM, Momentum Software Corp., Digital Equipment Corp. and

PeerLogic stepped in to fill the breach with stable products and support.

Each product has a different way to assure message delivery,

consulting firm's Dante middleware architecture. Popular among financial institutions, Dante distributes nontraditional data types across multiple platforms, something traditional transaction processing monitors can't do.

Other industries that are heavily into MOM include insurance, health care and travel and tourism, where users need to grab information from multiple sources to prepare reservations for travelers.

Time-saver

AAA Auto Club South, Inc. uses MQSeries to cut the time of doing credit-card authorizations over the telephone. The club plans to use MQSeries to help route requests for AAA's Triptiks—personalized trip maps for AAA members—to the correct service provider.

Ovum Ltd., a consulting firm in the U.K., expects MOM sales to make up 23% of the overall middleware market by 2000. Traditional market-leading database middleware tools are expected to drop from a 73% share in 1994 to 19% in 2000.

The future is in the middle

MOM is starting to catch hold among users, but observers say vendors must first help would-be customers figure out what MOM is and why it would help them.

"The No. 1 problem for messaging middleware is identity crisis," said Ed Acly, an analyst at International Data Corp. in Framingham, Mass. Although other middleware segments are well-defined, "there is nothing like that for the MOM guys to rally around," he said, because MOM is still one of the new kids on the middleware block.

Two areas that could help the growth of MOM are groupware and the Internet.

Groupware offers collaborative features that middleware can enhance by pulling data into a group of applications or discussion database from outside sources. IBM has been working to capitalize on this by linking its MQSeries MOM to Notes.

Observers think the World Wide Web will help MOM by

simply being an example of a universal networking infrastructure. MOM vendors could refer to the Web and show users that MOM could provide a similar universal networking infrastructure for their companies. It wouldn't matter which protocols or platforms companies are running; the data could still be carried among applications.

Will any one vendor dominate the market? Many small players have made themselves a niche (see chart at left).

But at least one analyst expects a certain group to rise to the top.

"The hardware vendors will have an advantage here because of their previous knowledge of mission-critical systems," said Susan Eustis, vice president of Wintergreen Research, Inc. in Lexington, Mass.

When you try to capture mainframe or server data from a desktop application, you really need a heavy-duty, mission-critical product, she said.

—Tim Ouellette

3M

LS-120 diskettes require compatible drives. The circle-pyramid logo is a trademark of 3M. ©3M 1996

Larger files. Overcrowded hard drives. Piles of diskettes. Sound familiar? Now you can reliably meet your high capacity storage needs. Introducing the 3M brand LS-120 laser servo 120 MB diskette, the next standard in diskette technology. It works like the diskettes you're using now. Only it's faster and it holds more. Up to five times faster and holds 80 times more. Multi-media presentations. Downloaded Internet files. Large database files.

What's more, new LS-120 drives also read and write your current diskettes up to three times faster. No wonder more businesses protect important information on 3M brand data storage products than on any other brand. Look for the new LS-120 drives built into new Compaq PCs or available as an option. For information call 1-800-888-1889, ext. 4001, e-mail us at datastorage@mnm.com, or visit our Web site at www.mnm.com/datastorage.

The reasons
for our new
120 MB diskette
just keep
stacking up.

It never works
as well without
the middle.

**Presenting
IBM Software Servers.
Now the client/server
picture is complete.**

It's amazing how well client/server computing can work. Especially when you put something between your clients and servers that makes everything work together more smoothly. That's why

we created seven new IBM Software Servers. They support all major clients, and they'll run on the platform of your choice: OS/2[®], Windows NT[™] or AIX[®]. And best of all, they're designed to work together seamlessly. All for one and one for all. For your complimentary Preview Kit, visit www.software.ibm.com/info/gell0/ or, if you prefer, you can call us at 1 800 IBM-7955, ext. gell0.

Lotus Notes^{*}

The leader in messaging and groupware.

Database Server

Helps workgroups and companies share important data.

Internet Connection Server

A solid foundation for building Web-based business.

Communications Server

A powerful gateway for connecting diverse systems.

Transaction Server

A flexible infrastructure for mission-critical applications.

Directory and Security Server

Manages companywide users and resources from one desk.

Systems Management Server

Automates management of multivendor distributed systems.

Solutions for a small planet[™]

You can also reach us by e-mail at thmsurvey@ibmupgrade.com. In Canada, call 1 800 IBM CALL, ext. 8119. The IBM home page is located at www.ibm.com. Market for
intranet security
tools nearly doubles, 66

The Internet

Development tools head for the Web

VBNet runs client/server apps over 'net

By Mitch Wagner

TVOBJECTS Corp. in Princeton, N.J., has introduced a software development tool that provides a graphical front end for generating Visual Basic applications that run on the World Wide Web.

The software can also be used to convert Visual Basic applications to run on the Internet.

The VBNet software, an add-on to Microsoft Corp.'s Visual Basic 4.0, lets Visual Basic programmers write Internet-enabled client/server applications faster, without requiring that users learn nitty-gritty details about 'net protocols and application interfaces.

"What's missing on the Web is a point-and-click development environment," said Mark Istvan, a webmaster at the U.S. Coast Guard Operations Systems Center in Martinsburg, W. Va. "You can spend a lot of time on [Hyper-text Markup Language] coding, just designing how you want your user interface to look. VBNet gets around that. It allows me to concentrate on what I want to do

and when I want to do it."

Istvan is using VBNet to build a personnel application to track 39,000 volunteer officers for the Coast Guard. He said VBNet will let him construct an application that will run as a straightforward client/server Visual Basic application and as an intranet application.

VBNet gives users access to data stored in corporate databases via the Open Database Connectivity interface, which most database vendors support.

Systems requirements

VBNet requires that users run their Web servers on Microsoft's Internet Information Server. A version that runs with the more popular Netscape Communications Corp. server is planned within months, said Andy Goren, president of TVObjects.

On the desktop side, the software is compatible with most systems. It runs with Microsoft's Explorer or Netscape's Navigator; those two Web browsers hold more than 75% of the market.

The VBNet software, available now, costs \$197.

Borland's Delphi made Web-compatible

By Frank Hayes

Delphi is heading for the 'net.

Borland International, Inc. later this month will ship an upgraded version of its Delphi visual development system designed to help build Internet applications and World Wide Web sites.

The \$799 release — an updated version of Delphi Developer 2.0 — includes Delphi components that support electronic mail, file transfers and Internet newsgroups, according to the Scotts Valley, Calif., company.

The update also supports Microsoft Corp.'s Internet Information Server and includes Delta-Point QuickSite, a Web-server management tool.

Delphi's enterprise version,

which costs \$1,999, will also add improved database connectivity and better integration with third-party analysis, design and testing tools.

One user said it will be nice for Delphi users to be able to build Internet sites without having to learn another development tool.

"We've already outsourced some Internet development because we're backlogged with all our own efforts right now," said Chris Moreau, client/server development manager at Sara Lee Knit Products Corp. in Winston-Salem, N.C., where Delphi is the standard development tool. "But it's extremely cost-effective — if we don't have to learn another tool — to do Internet development ourselves."

Clothier automates communication

By Mitch Wagner

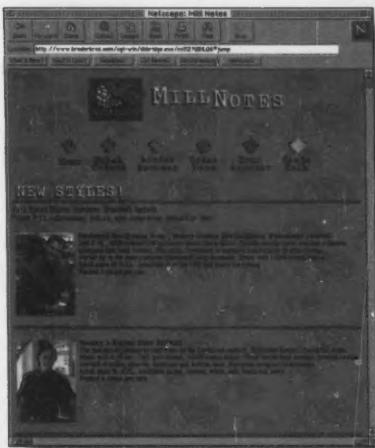

Fruit of the Loom, Inc. doesn't want to let electronic commerce catch the company with its shorts down.

The \$2.4 billion Chicago maker of underwear, T-shirts and casual apparel plans this month to launch Activewear Online, a business-to-business World Wide Web site to let other businesses order T-shirts and sweatshirts for custom decoration.

"A decorator might make 12,000 Grateful Dead T-shirts out of our product," said Charles Kirk, senior vice president and chief information officer at Fruit of the Loom. About one-third of the company's sales come from those products, called the Activewear line.

Activewear Online is Fruit of the Loom's attempt to automate critical business communication with the wholesalers who supply Activewear products to the smaller shops that decorate and resell them.

It is a Web server with a twist: The server is a

Hackers step up attacks

New assaults include Linux break-ins, mail bombs

By Gary H. Anthes

Old favorites, such as password sniffing, appeared on the latest summary of most popular computer attacks reported recently by the Computer Emergency Response Team (CERT). But some newer items appeared as well: a rash of assaults on Linux machines and an epidemic of mail bombs and spam attacks.

In a recent alert, the CERT, which operates out of the Software Engineering Institute at Carnegie Mellon University in Pittsburgh, said it is seeing frequent attacks of the following types:

- **Password cracking.** An intruder steals a password file, decrypts the passwords and uses them

A sample of the most common security attacks

- Password cracking
- Spammering

The Internet

Market for intranet security products nearly doubles

By Kristi Essick

Network break-ins still top the list of fears for most network administrators and private users of the Internet, according to attendees of Northern Telecom Ltd.'s Network-Wide Security seminar.

Because of those concerns, and because of the speed at which firms are deploying intranets, the market for products such as encryption tools and secure servers aimed at intranet development has more than doubled in the past six months, said Rick Spence, an analyst at market researcher Dataquest in San Jose, Calif.

Companies and users are still reluctant to put mission-critical or personal data such as medical records and credit-card information on a network where there is the slightest security risk, he said.

Another conference attendee said he wouldn't completely trust any encryption

product available today. "It's a continual horse race between the security companies and the hackers. I don't see the race being won by either side any time soon," said

Scott Figgins, a programmer/analyst at Sterling Software, Inc.

Figgins is working with NASA to develop intranets secured by Nortel, Inc.'s public-key encryption product, Entrust.

Favorable response

Entrust did get a vote of confidence from attendees at the Nortel conference, which focused on how companies such as electronic-mail vendor Qualcomm, Inc. and electronic forms vendor Shana Corp. are working with Nortel to get their applications to work with Entrust.

"Entrust is becoming the de facto standard," said Dan Phan, a software design engineer at Hewlett-Packard Co. who is helping financial institutions set up networks

Areas of concern

secured by the Entrust system. "It's trustworthy enough for the banks I work with, and the public and private key management is much easier than it is with Pretty Good Privacy," a freeware public key encryption program.

Entrust, certified by the National Institute of Standards and Technology, is based on X.509 public key certificate technology. It allows users to send and receive encrypted data over networks and the Internet, ac-

cording to Ian Curry, Entrust product manager. Related Nortel products also include a secure server, an X.500 directory and a hardware-based security add-on.

Analysts, users and security product managers agree that network security is a field in which firms can be made or broken with the introduction of a stellar product.

Essick writes for the IDG News Service in San Mateo, Calif.

Fruit of the Loom

CONTINUED FROM PAGE 65

Mountain View, Calif. Connect also wrote the software.

The twist on the Web server is that wholesalers can customize the front end of the site, store their inventory data in the database and access the server through their own uniform resource locator.

The result is that each wholesaler that subscribes to Activewear Online will appear to have its own Web site, from which customers can order apparel. Orders are then faxed from Connect to the wholesaler, which fills the order from its own stock.

Fruit of the Loom plans to open the server to about 50 of its biggest wholesalers this summer. First up: Broder Bros. Co. in Plymouth, Mich.

"We jumped right on it," said Todd Turkin, executive vice president of Broder

Bros. "We're confident that the Internet will increase in importance—both in terms of orders coming in and in terms of the number of services we can offer on the 'net.' In the future, Broder Bros. hopes to let its customers scan through its inventory online, see invoices and participate in real-time chat with experts in decorating.

Fruit of the Loom won't charge wholesalers for a place on the Web server.

The firm plans to make its money on the increased volume of apparel sales, which

officials said will be attributable to the comparative ease of online transactions vs. the current way of doing things. Decorator shops now telephone in orders to distributors, a time-consuming process that usually must take place during business hours.

Fruit of the Loom started planning the site in early winter. The company information systems department oversaw the technical implementation, working with internal marketing staff. But much of the work was outsourced, Kirk said.

Computer attacks

CONTINUED FROM PAGE 65

being used more often because local Internet access providers like the freely available Unix operating system, said Kathy Fithen, CERT's team leader for strategic incident response. On the down side, Linux is especially vulnerable because it exists in several variants. This, in turn, provides hackers with an opportunity because the variants make it harder to keep up with security holes and patches, she said.

Fithen said hackers are far more effective now than even a year ago because of the availability of automated hacking tools. "The sophisticated intruders are making the tools available to the community so novices can use them to break in to systems," she said.

These tools include software that will automatically capture and decrypt passwords, dial modems and attempt to log in and probe systems for security holes.

Peter Tippett, president of the National Computer Security Association in Carlisle, Pa., said experts have for years predicted "IP spoofing," in which a hacker masquerades as a trusted host by predicting message sequence numbers. Once the notori-

ous hacker Kevin Mitnick perfected the ploy, several automated IP spoofing tools were written, Tippett said.

To protect against password compromises, the CERT recommends using a "shadow" password file that moves passwords to a more protected file.

It also recommends using one-time passwords that can't be reused by a hacker who happens to intercept one on the network. The CERT's advice about computer security risks and protection is available on the Internet at <http://info.cert.org/pub/>.

William J. Orvis, member of the Computer Incident Advisory Capability (CIAC) team at Lawrence Livermore National Laboratory, said the most common attacks are simple probes such as a request for a password file using Trivial File Transfer Protocol. The CIAC is a facility similar to the CERT that is run by the U.S. Department of Energy laboratory in Livermore, Calif.

Tippett said a disturbing recent development not included in the CERT alert is break-ins to Internet access providers' systems. There have been three in the past month, he said.

He said a hacker who gains control of an access provider's host then has carte blanche on the customer World Wide Web sites maintained by the provider and to electronic mail flowing through the host.

THE NETWORK IS THE COMPUTER[™]

The Best Choice In Standards-Based IntraNet Solutions Is Clear.

The NetManage® IntraNet Family lets workgroups work together better than ever. It includes everything necessary to build a powerful corporate IntraNet. And since it's based on Internet standards, the IntraNet you build today can grow with you into the next century.

The Family includes all the necessary client and server applications to *access* information no matter where it's located, *collaborate* with workgroups and share information, *develop* applications, and *manage* IntraNet performance.

NEW! NetManage™ Chameleon IntraNet Desktop. With NFS!

- The most complete, best value in IntraNet desktop suites.
- Includes NFS for Microsoft Windows 95, NT, 3.1.
- Highly integrated—includes host access, e-mail and messaging, Internet access, group collaboration, file and print sharing, and desktop management.
- Access any server.

NEW! NetManage ECCO PRO™ Workgroup

- The most award-winning Personal Information Manager for Windows is now available for workgroups.
- Low administration—no server required.
- Lets workgroups collaborate, schedule, plan, and synchronize in realtime.

NEW! NetManage IntraNet HostLink™

- Everything you need in host connectivity to access UNIX, mainframe and midrange systems now comes in one box.
- Seamlessly deploy terminal emulation across your enterprise.

NEW! NetManage IntraNet Server

- First standards-based collaboration server with a discussion forum server for Windows NT.
- Complete server suite—includes forums, DNS, Web, and NFS file and print.
- Highly scalable, easy to install and manage.
- Includes free client software.

NEW! NetManage JetMail™

- The only complete standards-based e-mail client & server solution on the market.
- Seamless Internet access.
- Runs on all Windows platforms.
- Easy to install and manage.

NEW! NetManage XoftWare™

- The best value in PC X servers for Windows and Macintosh.
- Fastest PC X server you can buy.
- Includes complete suite of host and Internet connectivity solutions, remote and network capabilities.
- Microsoft-certified.

Corporate Strategies

GIS technology makes inroads

By April Jacobs
PALM SPRINGS, CALIF.

Government agencies and utility companies remain the primary users of geographic information systems (GIS), but mainstream corporations are beginning to navigate their way to the mapping technology.

In fact, increased corporate use of GIS technology to improve customer service and cut costs is expected to help propel the overall market from \$862 million last year to \$1.7 billion in 2000, according to Kathey Hale, a principal analyst at Dataquest in San Jose, Calif.

For example, retail giant Sears, Roebuck and Co. is in-

stalling a GIS-based system for routing the trucks that make 4 million home deliveries a year, according to Steven Rutkowski, senior systems manager at Sears in Chicago.

The project, which began in 1993 and will be completed this year, has helped Sears find the best routes for the 800 trucks that bring furniture and appliances to customers, he said.

The GIS system has slashed the time it takes to map out a delivery route from about 2½ hours, based on the knowledge of local truckers, to 20 minutes. And Sears has been able to reduce drivers' mileage by nearly a mile per delivery.

"It actually took some of our facilities up to eight hours to

produce routes, so it was astounding to us to see this go as fast as it did," Rutkowski said. The firm can give customers a two-hour time frame in which their goods will be delivered, as opposed to the previous a.m./p.m. window.

Mapping technology

The system is based on IBM RS/6000 servers and Esri, Inc.'s Arc/Info GIS software, he said. Orders are filled by using Esri's ArcView desktop mapping tool, he said.

Address matching also has improved, Rutkowski said. Under the old system, trucks went to the right address 66% to 71% of the time; accuracy now ranges between 86% and 91%. Some facilities reach 96% accuracy.

Rutkowski wouldn't give the specific cost of the new system,

MetLife Realty uses GIS technology to manage and review about \$1.3 billion worth of property for investors

but he said it will easily pay for itself within a year.

MetLife Realty Group, Inc. in White Plains, N.Y., a wholly owned subsidiary of Metropolitan Life Insurance Co., also uses GIS. The firm, which manages about \$1.3 billion in property for investors, is implementing a system it hopes will provide data that improves customers' return on investment.

With GIS, users can access data critical to evaluating a property's value and performance potential. Users in dif-

ferent departments also will be able to access information specific to the work they do. "At any given time, there's 300 properties in various stages of review over a period of one year," said Gilbert Castle, a consultant at MetLife Realty.

Hale said companies are making geography part of how they analyze their business. "You're talking about optimizing a business. I'm starting to see some companies leveraging spatial analysis in their business models," she said.

Vendors feed user frenzy for rapid application development

By Julia King

Forget re-engineering.

Companies want state-of-the-art information systems in record time, and systems integrators are coming up with more ways to provide them.

Hewlett-Packard Co.'s Professional Services Organization, Cambridge Technology

Partners, Inc. (CTP) and Actium Corp. have all announced new or enhanced rapid application development programs.

"With technology life cycles so short and time to market being such a critical advantage, speed of implementation has become one of users' key [integrator] selection criteria," said Susan Tann, a senior analyst at

International Data Corp. in Framingham, Mass.

HP is targeting its new R/3 rapid implementation service at midrange companies that require little customization.

To speed installations, it uses standard templates to define business processes. It also compresses the design, configuration and training phases of a

traditional SAP AG implementation into a single four- to six-month period.

Using these techniques, HP claims it can cut the time and cost of R/3 implementations in half.

Reaching consensus

At JBL Professional, an audio equipment maker in Northridge, Calif., it took an HP team four months to implement the finance, sales and distribution, and control and materials management modules of R/3.

The total cost of the project, including software licenses, hardware and implementation, was just over \$1 million.

"We had been receiving quotes [from other R/3 integrators] of a year to 15 months," said Dennis Barry, JBL's vice president of finance and administration.

HP's fixed price on the project was about one-third of what

JBL expected to pay, Barry said.

CTP in Cambridge, Mass., and Actium in Conshohocken, Pa., develop custom applications using client/server and object-oriented technologies. Both firms work on a fixed-time, fixed-price basis.

CTP's methodology for bringing projects in rapidly and on budget concentrates on "gaining consensus so things get done quickly," said Chris Greendale, a co-founder and senior vice president of marketing at the \$132 million firm.

In CTP's rapid solutions workshops, teams of developers from client sites are put together in a room for a week "and basically can't come out until they've reached a conclusion about the functionality they want to build," Greendale explained.

At the end of the week, the *Fast rollout, page 73*

Set point			
Systems Integrators with fixed pricing			
Systems integrators	Hewlett-Packard's Professional Services Organization	Cambridge Technology Partners	Actium

AN INDUSTRY UPDATE WRITTEN BY INTERNATIONAL DATA CORPORATION AND SPONSORED BY NOVELL, INC.

Meeting the Challenge of Client-Server Computing

Maximizing Return-on-Investment of Network Computing

The migration to client-server computing is affecting organizations both large and small almost everywhere on the planet. Computer users today have extensive access to global network-based resources, including communication gateways to other companies, individuals, and markets worldwide. Signs of this connectedness abound:

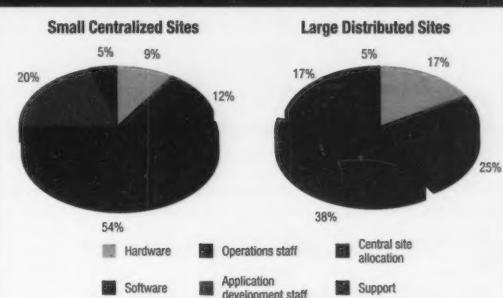

- Last year the number of LAN users worldwide hit nearly 100 million, double the number in 1993. By 1999 the number will double again.
- In the same year the number of people in the world with electronic mail boxes topped 40 million. By 1999 the number will be over 125 million.
- Groupware users numbered over 30 million worldwide by the end of 1995; by 1999 they will number over 250 million.

So we are heading for a wired workplace, a wired marketplace, even a wired society. However, there is a price to be paid for all this connectivity. The nearly universal implementation of client-server systems requires living with new levels of complexity and new hardware and software that people must be trained to use. Moreover, highly skilled personnel must be hired to install, manage, maintain, and administer these far-flung networks. The result is that staffing costs have become the largest contributor to total networked computing costs, regardless of the size of the installation (see Figure 1).

Until now, companies have justified the costs and complexities of client-server computing by competitive advantage—it is a very flexible and adaptable computing style. But when client-server is the norm, where will the competitive advantage lie?

IDC believes that companies that learn to manage their networked resources through technology and training will win out over their peers in the long run. Companies that understand the true costs and true benefits of client-server computing

Figure 1 — The Hidden Costs of Client-Server

Source: International Data Corporation, 1996

will generate quicker return for their investments. Companies that relentlessly optimize, integrate, and upgrade existing systems will stretch IT resources further and be able to reinvest sooner than competitors taking a wait-and-see approach.

Areas of Opportunity

IDC and Novell have teamed to produce this White Paper in order to help IT managers develop a strategy for maximizing return on investment in networked computing resources. It is the executive overview of three studies researched and written by IDC and sponsored by Novell. In the research it conducted,

Driving Down Networking Costs

GroupWise:

Typical annual return-per-user of 334%

Nearly \$400,000 a year saved in phone costs at Farmland Foods

Courier costs cut \$16,000 a year at Sheppard, Mullin, Richter & Hampton

NetWare 4:

On average 15% less expensive than NT Server from Microsoft

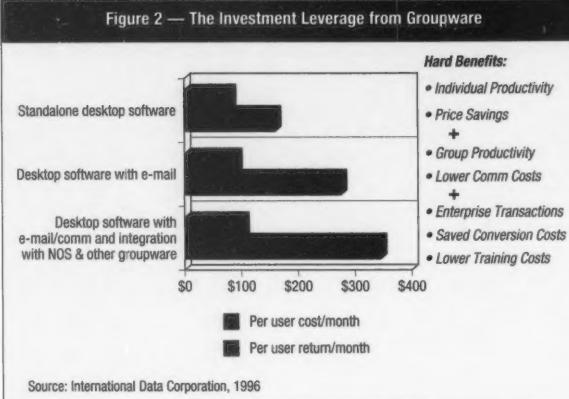

50% increase in users supported by a single server

ManageWise:

\$95,784 savings in business efficiency per 100 users

50% reduction in network downtime

19.7 day payback

IDC found three areas of networked computing that are focal points for ROI leverage:

1. The choice and use of communication applications such as e-mail and groupware
2. The choice and use of next-generation network operating systems
3. The use of advanced network and system management tools

In addition, IDC found that when products in support of all three of these areas work together in an integrated fashion—such as Novell's GroupWise, NetWare 4.1, and ManageWise products—benefits are compounded. Support and training costs are lower, conversions and upgrades occur faster, applications come on stream sooner, and downtime is reduced.

Applications for the Next Wave

The migration to client-server computing is a quest to provide users with access to information and computer resources beyond their desks. One of the key tools for this is groupware software, epitomized by Novell's GroupWise, software which integrates e-mail with scheduling, calendaring, and other workgroup oriented functions. The market for groupware is exploding as organizations find they can use it—specifically the e-mail function—as a platform for providing workgroup and even enterprise-wide access to information and resources.

In the research IDC conducted, almost half of the business benefits organizations received from migrating to groupware came from better internal and external communications. For instance, Farmland Foods, a \$2 billion dollar meat processing company, found that since installing GroupWise, documents once faxed in 15 minutes now take less than five to e-mail. Further, the use of GroupWise saved almost \$400,000 in voice phone calls a year.

Figure 2 illustrates how electronic communication and collaboration generate cascading benefits. Standalone desktop software can impact individual productivity, but when combined with e-mail, that software can improve the productivity of a whole workgroup, not just the individual user. If the e-mail is specifically designed to work with the desktop software and with the network software, as say Novell's GroupWise is with NetWare 4.1, then those workgroup benefits are compounded.

This efficiency pays real dividends. When Sheppard, Mullin, Richter & Hampton, a Los Angeles law firm, made the move to GroupWise it found the support ratio for lawyers dropped from one assistant for every two lawyers to one for every three. GroupWise scheduling cut count-

less hours in tasks as routine as setting up meetings; GroupWise e-mail cut courier costs by \$16,000 a year.

For most companies, an investment in groupware is considered an incremental cost. The hardware is already in place, as is the network. Moreover, the support costs—which account for more than 50% of the cost of operating a networked PC—are shared across dozens of applications.

But even with all the hardware, network, and support costs amortized across the groupware software, it's a bargain. IDC's research with Novell's GroupWise customers found that a typical installation required only about \$250 in fully-loaded first-year costs—less than 5% of the annual cost of operating and supporting an end-user personal computer.

For that \$250 investment, those same GroupWise customers found that their first-year return was over \$800 on lowered communication and clerical costs alone. Meanwhile, they accrued an array of other concrete benefits, such as fewer meetings (and thus less travel and meeting administration), easier document handling, and so on. For every single GroupWise customer interviewed by IDC, return-on-investment exceeded expectations.

Modernizing the Network

If the LAN is the heart of client-server computing, then the network operating system is its soul. As LANs have evolved from peripheral information systems to the primary components of mission-critical systems, they have become more robust and more scalable. Along the way they have also provided IS personnel with the tools to manage network resources as never before.

In fact, powerful new management capabilities are why many people are migrating to NetWare 4.1. With more than 375,000

licenses installed worldwide as of 1995, it is the most popular network operating system. Three key reasons for its popularity are:

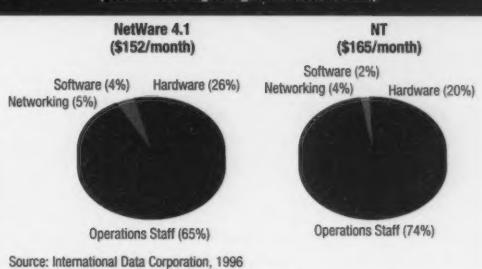

- Greater functionality
- Improved management
- Directory services

Figure 3 illustrates how survey respondents believe migrating to NetWare 4.1 has enhanced network productivity—with ease of administration at the top of the list, mentioned by nearly 40% of respondents. NetWare 4.1's greater functionality has promoted companies' reliance on LANs and delivered on the ultimate promise of client-server—increased productivity.

According to recent surveys conducted by IDC, LAN managers report remarkable improvements in managing their networks under NetWare 4.1. Although they expected the number of nodes on their networks to grow by 260% in the 12 months following installation, they anticipated the number of file servers on the network would grow by only 163%. In other words, under NetWare 4.1, they expect to increase the ratio of users per server from 41 to 60—an improvement of 50%.

In addition to increasing the number of users per server, NetWare 4.1 provides a single point of administration with Novell Directory Services (NDS) that results in a lower cost of network administration. Figure 4 shows how, in medium-sized

**Figure 4 — Network Cost-to-Use at Medium (300 User) Sites
(Costs After Migrating from NetWare 3.X)**

sites, NetWare 4.1 generates 14% lower network administration costs than Microsoft NT, primarily by increasing the user to support staff ratio.

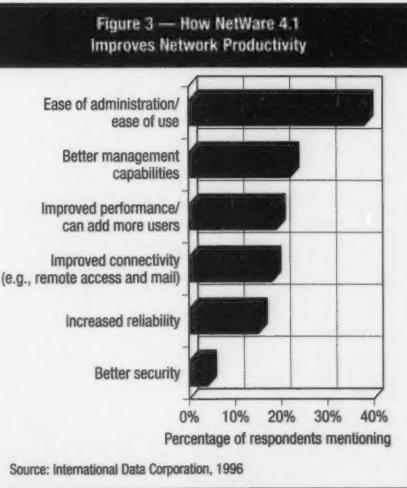

Novell and other networking companies have set their sights on developing new technologies that will make tomorrow's networks more efficient and flexible. Novell has developed a Smart Global Network strategy, which entails making the network available to anyone—anytime, anywhere. An essential component of the Smart Global Network is Novell Directory Services (NDS), which enables companies to keep track of and connect all of a network's users, workgroups, hardware and software on one common access and administrative framework. NDS provides directory services technology that can handle the management of countless resources on heterogeneous systems spread around the globe. Also fundamental to Novell's vision of the future is an open set of application programming interfaces (APIs) that will make it easy to incorporate NDS and other NetWare 4 networking services into distributed applications.

Providing End-to-End Network Management

Staffing costs and end-user productivity are the issues that keep IS managers awake at night. And that has never been more true than it is today. As networks expand and intertwine, the critical success factors for network managers will include:

- Increasing network uptime, both in operation and when installing new users or applications
- Increasing efficiency by supporting rapid network growth without commensurate growth in staff
- Increasing responsiveness, fixing problems in a way that minimizes idle time for users or within business processes

To meet these needs, Novell offers ManageWise. It combines both network management and PC administration into a single, integrated package. Previously, most PC administration and LAN management products worked independently of one another, each requiring dedicated staff and resources.

ManageWise is the integrated solution that offers a single view of the network. It provides analysis tools for understanding bottlenecks; permits the configuration, inventory, and diagnostics of PCs from a single local or remote site; and provides tools for monitoring and managing remote and local servers. IDC's research demonstrates that even small and medium-sized companies can achieve significant cost savings by implementing ManageWise (see Figure 5). Network managers found that the most significant gains in efficiency were realized in server operation and help desk functions. Using ManageWise also increased LAN manager responsiveness. Before implementation, only 30% of network or end-user problems could be solved from a central site; afterwards, that number rose to 60%. This is especially important for companies with highly decentralized operations.

Since the software-licensing, maintenance, and training costs of a product like ManageWise are low compared to the number of users potentially affected, the return on investment can be surprisingly high. Across the survey base polled by IDC, ManageWise paid for itself on average within 19.7 days.

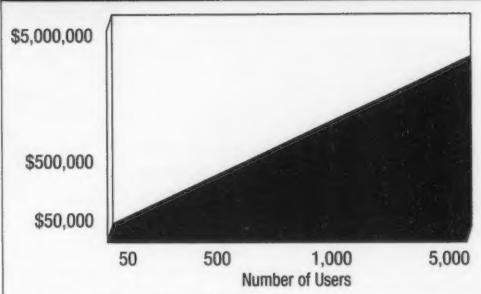

For every 100 users, implementing integrated management with ManageWise saved \$95,784 annually. These savings are attributable to the following:

- More efficient systems management, including an increase of 33% in the number of servers and 25% in the number of PCs a staff person can support, and a decrease in travel of 53%, leading to annual cost savings of \$14,500
- Significant reductions in the time required to perform key management tasks—such as five hours in moves and changes, nine hours in server maintenance and configuration, seven hours in help desk and support, four hours in problem tracking, three hours in printer maintenance, etc.—saving \$30,844 annually
- Dramatic reductions in network downtime (over 50%) due to network outages, delays addressing problems at the desktop, or time spent installing and configuring applications, generating annual savings of \$50,440

Cost-Savings and Client-Server: They Aren't Mutually Exclusive

Believe it or not, return on investment in networking can be quantified. While it may sometimes seem that networks are growing out of control, vendors like Novell are in fact working diligently to develop products for simplified, easily managed

Figure 5 — Average Annual Savings From ManageWise

Source: International Data Corporation, 1996

local, wide-area, and global networks. Because of the strategic and financial advantages of networking wherever systems reside and users roam, organizations will be forced to expand the reach and complexity of their networks simply to remain competitive.

Astute companies will concentrate on migrating to client-server computing in ways that maximize both the resources available to run networks and the effectiveness of those who ultimately generate revenues and profits—namely, end users.

Call to Action

This is an executive overview of a three-part series of White Papers entitled:

- Novell GroupWise: Leveraging Desktop and Network Investments
- Novell NetWare 4.1: Reducing Cost of Ownership
- Novell ManageWise: Maximizing Returns on Networking Investments

Document management helps medicine go down

Pharmaceutical firms speed new drug applications to FDA

By Thomas Hoffman

A new drug can be worth up to \$1 million a day to pharmaceutical companies that reach the market first, so every second counts in the race to submit new drug applications (NDA) to the U.S. Food and Drug Administration.

The trouble is, NDAs involve gigabytes of data and have to be shuttled among a slew of departments such as clinical research and drug regulatory affairs for viewing and approval.

To get its NDAs out the door faster, Hoechst Marion Roussel, Inc. installed a document management system that automated most of its manual data-gathering processes.

The result: What normally would have been a 40-week NDA for Dolasetron, a drug that prevents nausea and vomiting in chemotherapy patients, was slashed to 17 weeks. The NDA for Fexofenadine, an antihistamine, was reduced from 52 weeks to 24 weeks.

Hoechst is able to project these time lines based on historical patterns and how long it normally would have taken to complete such projects with the same amount of data.

Hoechst early year last began installing a set of custom packages from Waltham, Mass.-based Interleaf, Inc., such as Interleaf 5, WorldView and Interleaf RDM.

About 30 Hewlett-Packard Co. Unix workstation users share the documents via TCP/IP Ethernet connections to HP 9000 Unix servers. Another 250 staff members can view the documents and write ancillary reports.

Quick deployment

Because Dolasetron and Fexofenadine were in the pipeline before the document management project began, Hoechst had to hustle to get the system operational.

"That was our biggest challenge — we had to get a lot of servers in quickly and increase the bandwidth on the network," said Mike Armstrong, manager of systems integration at the Kansas City, Mo.-based firm.

By putting the servers on a

Hoechst Marion Roussel's new document management system helped the company get its new drug applications to the FDA faster

DRUG	APPROVAL TIME BEFORE THE NEW SYSTEM*	APPROVAL TIME AFTER THE NEW SYSTEM

Fexofenadine (antihistamine)	52 weeks	24 weeks

*Estimates

"city" Ethernet ring, Hoechst was able to achieve network speeds of 100M bit/sec.

Hoechst spent \$6 million on the system, with about \$4.3 million going to Interleaf for software and consulting services, Armstrong said.

After the system went live last March, Hoechst was able to submit NDAs on Fexofenadine in July and Dolasetron in September.

The FDA hasn't approved the drugs yet, but the time the system saved Hoechst may prove critical in the long run, industry experts said.

"Document management has become a key area for these com-

panies as they work with the FDA," said Scott McCready, principal at IDC/Avante, a market research firm in Framingham, Mass.

For example, it isn't unusual for pharmaceutical researchers to spend as much as 25% of their time looking for documents, McCready said. "It's amazing how many pharmaceutical companies focus too much on research and not the documentation," he said.

He said DepoTech Corp. in San Diego, Hoffmann-LaRoche, Inc. in Nutley, NJ., and Glaxo Wellcome in London are the leaders in using technology for working with the FDA.

Fast rollout

CONTINUED FROM PAGE 71

team presents its systems requirements to its company's top executive sponsor.

"We have had 100% success with that technique because not one person on the design team wants to fall on their face when the CEO comes in," he said.

Both sides benefit

Actium's rapid development method involves breaking large

projects into several time chunks, each with a set deadline, price tag and payback. The integrator also has a library of more than 100 business objects, which it uses as a starting point on most new object-oriented applications.

Actium also will work under a so-called gain-sharing arrangement. If a gain-sharing project comes in ahead of time and under budget, the client and integrator split the savings. If the integrator misses the deadline or runs over budget, all work beyond the original scope of the contract is performed at a reduced rate.

tures and formats.

After whittling down a list of 27 products to four competing data access products that were tested in Shell's Philippines operating company, Business Objects came out on top. It is from a French relational database query tool maker of the same name.

Business Objects lets people use business terms such as "customer" and "product" rather than database terms, thus lowering the skill threshold required to query a database, said Simon Bennett, who is responsible for end-user access to data at Shell Australia in Melbourne.

Though the central IS group in London recommended Business Objects, it didn't decree that users adopt it, said Shell spokesman Quentin Langley. Rather, the group sought standardization through persuasion and attrition at the local level.

At Shell U.K.'s Exploration and Production division in Aberdeen, Scotland, persuasion fell to Helene de Beer, application standards manager and planner. De Beer's division has an information

technology staff of 120 people who, in turn, advise 3,200 users in three locations in Great Britain.

De Beer's strategy was to make use of "cutting-edge" users — that small group of employees at any company with a zest for trying new technology.

"Once you've got one person who can illustrate the use and the advantages ... [of new technology, you] start building a network" of users, de Beer said.

Project takes off

For de Beer's division, the initial project was a database of helicopter and airplane flight schedules to and from Shell's offshore platforms in the North Sea. Shell used Business Objects to retrieve statistics on flight use by asking questions such as how many flights were canceled or how many flights had fewer than a certain number of people on board at a given time.

The database worked well and provided de Beer with a real-life

example from a Shell-specific application. "I've found that works best" to persuade people, de Beer said.

Human nature proved no different Down Under.

Bennett's users had been using

Microsoft Corp.'s Access to query corporate data, according to Bennett. As far as Shell Australia employees were concerned, Microsoft's tool had one very muscular advantage, which rendered the question of accessibility with Access almost beside the point: They were already using it.

Shell Australia started out slowly down the standardization road, with 12 pilot users in its Finance and Aviation divisions. But behind the scenes, the going hasn't been easy.

"Technically, we have had a number of irritating problems implementing [Business Objects] into our environment," Bennett said. For instance, local security policy prohibits Bennett from hav-

Query tools

By Rebecca Sykes

What happens when IS managers at a large international company decide to adopt a standard end-user query tool for their desktops?

Managers may hanker for the many benefits of standardization, ranging from simplifying application rollout to saving time and money by using a centralized test site to assess technology. But reaping those benefits requires sowing the seeds of cooperation and compliance. Information systems managers at multinational Shell Oil Co. found this out.

Corporate poll

Shell's first step toward getting the same query tool on its desktops around the world was to find out what users wanted that tool to look like. Shell's central IS group in London surveyed end users at the corporation's operating companies in about 140 countries.

The results were unequivocal: Users wanted better, easier access to existing information rather than snappy new fea-

ting a nonrecurring password, so every 60 days, the passwords in Business Objects must be redefined and the encrypted user identification/password must be manually copied to each user location. "Currently, this is not too bad because of the small user base, but [it] may become an issue for us later," Bennett said.

IS staff time can be a major component of an implementation's expense, and minimizing that difficulty can help ensure the adoption of the technology. One way the central IS office in London helps its worldwide users with maintenance issues is by sending out a Business Objects newsletter.

But the success or failure of standardizing on a tool comes down to whether users actually use it. Currently, 1,900 employees work with Business Objects, according to a Shell spokesman. The number of users will probably grow to 5,000, though that will take some time, he added.

Sykes writes for the IDG News Service's Boston bureau.

Managing

One Steamed

Fire and water. Cats and dogs. Gingrich and Clinton. And, as Steven Whyte can tell you, veteran and novice software developers belong on the same list.

At Whyte's previous company, his boss added three younger, inexperienced members to a seven-person client/server software development team. The trio, full of technical expertise but lacking procedural smarts, ran amok. When a task needed to be done, one of the three was likely to do it — without telling anyone or checking whether someone else was already working on it. Or, when older programmers would question a newcomer's code, wondering why it was done a certain way, the answer was usually a know-it-allish, "This is easiest." Arguments and delays marred the project. "It was hell," Whyte recalls.

Management wasn't much help at resolving the problem. "There was never a plan or procedure on how the work was to be issued," Whyte says. "The manager didn't describe the roles of anybody involved." Whyte is now a senior technical staff

That's what you could
wind up with if you
mix veterans and
young newcomers
on the same development
team and you don't
manage it well

member at Questra Consulting, a consulting and software development firm in Rochester, N.Y.

Information systems managers routinely mix veterans and relatively inexperienced developers on software projects. The practice is supposed to be a great way to mentor younger programmers, the stuff learning organizations are made of. But experiences such as Whyte's are more common than not. According to a four-year, \$1.5 million study of high-performance software development teams completed earlier this year, groups that mixed veteran and novice developers fare worse than teams where everyone is at the same experience level — even worse than teams where everyone is inexperienced [CW, Feb. 12, page 68].

"When experience is spread, performance and effectiveness of teams really falls," says Mehdi Ghods, senior principal scientist at The Boeing Co.'s Information Systems Division. Unless the team is sensitively directed and well-trained, he says, inexperienced people are going to hold up progress. (Boeing and IBM funded the study, which was conducted by two professors, Boston University's P.J. Guinan and Jay Cooprider at the University of Texas at Austin.)

And what about the project manager? It turns out he's not much good at resolving the infighting. These two-way conflicts are really three-pronged challenges for any organization seeking effective performance from its software development teams.

The first challenge: The old guys don't want to teach.

Teach? Sometimes these guys barely want to talk.

"Software engineers tend to view their job as a solo performance," explains Watts Humphrey. Humphrey, author of *Managing the Software Process* and *A Discipline for Software Engineering*, ran IBM's software development efforts before retiring 10 years ago and becoming a fellow at the Software Engineering Institute at Carnegie Mellon University in Pittsburgh. In his experience, programmers lack both interpersonal skills and the desire to acquire them. "There are some very experienced engineers out there who are very hardheaded. It's the 'old dog, new trick' problem."

"It does happen," Ghods concurs. "The more experienced team members display less tolerance for training people."

This is complicated by the resentment, jealousy and anxiety older programmers may feel about newcomers' more up-to-date technological expertise [CW, Jan. 29]. Faced with young know-it-alls, an experienced programmer will turn off what few social skills he might have had in the first place. Ghods, for instance, has seen experienced pro-

Team

By Jeremy Schlosberg

Make 'em talk

Looking to improve communication between the veterans and the rookies? Here are five suggestions:

- Make it clear to the team that learning is a two-way street — each side will have things to teach the other.
- Put a guru on the project, but make sure he knows that bringing inexperienced people along is part of the job, and it'll pay off on the next project.
- Earmark projects that are good for programmer training vs. projects that are mission critical, and allocate experienced and inexperienced programmers accordingly.
- Train everyone in project management. Chances are no one has had much of it so far.
- Hire well. The Windows Support Group's George Roukas says, "I'd much rather have people who are hungry and only stay a year or two than have people who can't learn quickly. By their nature, they'll be around for a long time."

grammers refuse to pass knowledge along to newcomers who don't appear to "accept them as senior people or appreciate their experience." "There are a lot of egos involved," Whyte says. "It can become a 'watch your back' kind of environment."

Some of this resentment is understandable. IS regularly turns the traditional master/apprentice relationship on its head. The "apprentices" often arrive in the workplace with more skills than the "masters," and they know it. That leads to the second challenge: young turks who don't want to learn.

Ghods has seen it in the trenches. "The junior person may think, 'I know object-oriented programming, and you, as a senior person — a Fortran developer — don't.' The senior person feels they have "a lot to offer anyway because the issue isn't technology; it's software development." It's a subtlety that's sometimes lost on such newcomers.

Besides the young and arrogant, there's also the young and passive. They show so little interest in learning from veterans that the veterans lose interest in teaching.

George Roukas, vice president of business development for the Windows Support Group, a Manhattan-based software developer, says the passive camp is divided into roughly two elements. The first might be deemed passive-aggressive: people who employ a disinterested veneer to irritate those they encounter. "I've definitely had

programmers who made that a high art form," Roukas says.

The second group, which is probably larger, comprises people who just don't know how to learn with enthusiasm and engagement, Roukas says. "They're sort of training couch potatoes," he says. Teaching someone who doesn't appear to be absorbing anything is trial enough for an experienced schoolteacher, never mind a software developer who would much rather produce something than teach someone in the first place.

All of these dynamics make the third challenge especially frustrating: The managers won't address the old-timer vs. newcomer issue head-on. It's the kind of nitty-gritty, touchy-feely manager stuff that isn't handled well in IS organizations, Humphrey says.

"Software engineering is a mix of the behavioral and the technical," he explains. But the human element is just what's overlooked in academia and business.

"The manager has to be good at communicating exactly what he's looking for on each side," Whyte says. By contrast, Whyte recounts a recently completed project at Questra that mixed veterans and newcomers. Each function point of the project was broken into smaller tasks and then rated by difficulty. The experienced members concentrated on the tougher tasks and the less experienced developers on the easier jobs. But as the project progressed, Whyte says, some of the less experienced people began handling some more difficult tasks because the project leader saw they could without compromising the schedule.

All this wouldn't have been possible without "exceptional communication" among the project leader, the experienced developers and the novices, Whyte says. Sometimes the veterans instruct the younger staff members, and sometimes the newbies — such as the programmer teaching Whyte about the Internet — teach the veterans.

But this picture of one big, happy software development family doesn't appear to be the norm. To Humphrey, the Boston University study's revelations regarding mixing veterans and rookies is sadly predictable.

"What you have, essentially, is somebody playing baseball and someone else playing soccer," he says. "You can't make a very good team out of that." ■

Schlosberg is a freelance writer in Cincinnati.

Insights for visionaries

Finally, a short book on information systems management that's long on substance.

V. Sambamurthy and MIS Quarterly Editor in Chief Robert W. Zmud, two professors at Florida State University in Tallahassee, have studied how to justify investments in "visionary" information technology applications. They're the risky, blockbuster systems that can throw open new opportunities for companies but are costly and tough to justify.

The result is a 129-page gem titled "Information Technology and Innovation: Strategies for Success." No dithering here — just clear and original findings, straightforward guidelines for action and case studies of seven carefully chosen companies.

Among the suggestions for getting funded are the following:

- **Get your story straight.** Picking the right strategy for communicating a project's benefits to others is the most important factor to win funding.
- **Match the pitch to the perception.** Does management peg IT as a support service? Focus on critical work processes. Is IS viewed strategically? Then link the project to a company's strategic vision.

Robert W. Zmud

the chief information officer and others in these projects, and the groundwork that CIOs must do in advance for these ideas to become realities. This is important stuff, particularly because the authors found that visionary projects can unseat CIOs before they start. Companies have hired new CIOs or third parties when the IS leadership lacked the technical credibility and vision to ensure the project gets done.

To order, call the Financial Executives Research Foundation, Inc. (affiliated with the Financial Executives Institute in Morristown, N.J.) at (800) 680-FERF. The cost is \$35 plus shipping and handling. — Allan E. Alter

Power tools

Workflow for the masses

Process Model, a flowcharting and modeling program, can teach the uninitiated manager to think about workflow

Jeffrey Gordon Angus

Process Model

Overall grade: B (Good)

Estimated price: \$695

Promodel Corp.

Orem, Utah

(801) 223-4600

Process Model

a tool from

Promodel

Corp., was

designed to create

process flowcharts and use them as underlying models to simulate business processes. Though it was designed for knowledgeable people to test re-engineering proposals, I'd like to nominate this straightforward graphical program as a great way to prod the department managers whom information systems supports into understanding how their own departments work.

Process Model is built on top of a leading flowchart program — ABC

FlowCharter from Micrografx, Inc. in Richardson, Texas. Using the bundled symbol palettes, you drag and drop symbols onto a page, thus connecting them.

The product is "smart" in important ways that make work easier and faster. Suppose you are a customer-service-minded manager at a busy bank branch, and you don't want customers to wait long to see a loan officer. As with conventional diagram-drawing programs, you create a flowchart linking a customer, a loan officer and a loan desk. What's different is that Process Model understands customers as events to be processed over and over again and loan officers as a limited resource. These smart connections allow for complex models that yield interesting results.

Once you've built the basic flowchart, you can assign probabilities, link the chart to already-created models and run the results through the simulation engine. You can show, for example, the probabilities of specific results. You can also calculate the costs of those results if you've attached dollar figures to choices. Process Model puts up an animated chart that shows the workflows and delivers analysis reports. It's easy to save an animated workflow chart, tweak conditions, run the process over again and compare results.

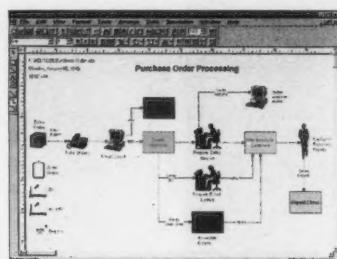

Process Model requires Windows NT or Windows 95, a minimum 486 processor and 16M bytes of RAM because it makes extensive use of OLE. The beta version we tested isn't as snappy and responsive as Clear Software, Inc.'s Clear Process [CW, April 1], but it doesn't pay to judge the beta as a predictor of the delivered product's speed.

Strong points

And while Process Model's components don't integrate quite as smoothly as those of Clear Process, the product has some strong competitive traits of its own. For example, it comes bundled with the entire Micrografx ABC Graphics Suite. Beyond the flowcharting program, the suite includes Micrografx Designer,

a sophisticated drawing program; ABC SnapGraphics, a great low-end drawing program; and other tools. These make for a muscular set of tools to publish and present your finished models.

The online help and printed documentation are still under construction.

Process Model creates animated charts that show and analyze the workflow in action

tion. Unless there are major changes before it ships, the manual is very strong on detailing the program's components but doesn't explain how to perform specific tasks.

The beta version of Process Model is very easy to use for anyone with experience in process modeling. More important, it is a user-friendly program even for managers who have a hard time figuring out how to make their departments work better. Do your organization a favor and drop a few copies of Process Model into those hands. ■

Gordon Angus is a systems analyst at The Data Works Ltd. in Seattle.

More talkback on telecommuting

On Feb. 12, we ran a story on how to manage telecommuting information systems staff members ["home@sweet.home"]. Anthony Weist wrote to us to say we had left out important questions about what happens when firing a telecommuting worker [CW, April 22]. He said telecommuters usually have equipment and data that would be hard to recover if that employee were terminated.

Several readers wrote to state their disagreement with Weist's position:

I think the question "what if you have to fire them" misses the whole point. Any data that is accessible by any employee is subject to compromise, regardless of whether the employee works from home or in a company office. How much data do you suppose can be compressed onto a diskette that fits in a shirt pocket?

*Byron McKenna
Network Systems Corp.
Highlands Ranch, Colo.*

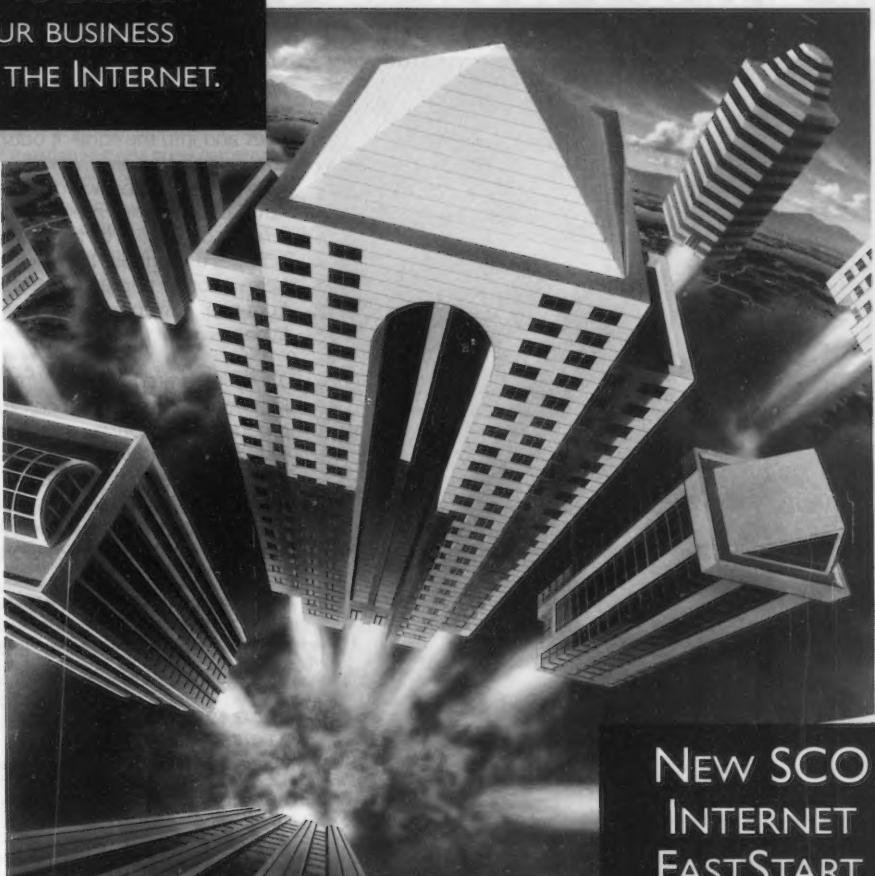

I manage a staff of more than 15 individuals, most of whom have remote access to our corporate database. Some of those employees have their own PCs at home, and some have company-owned hardware. Whenever we have separated an employee, we have never experienced a problem with retrieving the company's property. My experience with telecommuting has been nothing but positive in terms of enhanced morale, enhanced productivity and personnel management. Whenever I ask any of my employees to put in some extra time, they respond because they know that they can do it from home if need be.

*Larry Warehime
Nautica Enterprises, Inc.
New York*

THE MOST AFFORDABLE
WAY TO LAUNCH
YOUR BUSINESS
ONTO THE INTERNET.

NEW SCO
INTERNET
FASTSTART.
\$995.

THE WORLD'S MOST
AFFORDABLE BUSINESS
CRITICAL INTERNET SERVER.

Without SCO® Internet FastStart, deploying Internet access across your enterprise is extremely expensive. FastStart gives you the power and reliability of a UNIX® system at a very low cost. And because it can be deployed on inexpensive Intel® processor-based servers, your hardware costs are lower, too.

FastStart lets you access, publish and conduct business on the Internet. And to share internal information via Intranets.

But it doesn't take a rocket scientist to install and maintain.

SCO Internet FastStart Includes:

- SCO OpenServer™ Enterprise
- Netscape Communications Server™
- Netscape Navigator™ 2.0
- Multi-line PPP and Multi-homing support
- Graphic Installation and Configuration Tool

Don't risk grounding your business with a more expensive, less reliable server solution. Call SCO today.

THE DAWN OF TRUE INTEROPERABILITY...

SEE THE LIGHT:

New Dimension Software's Enterprise Production Management™ solution brings distributed computing out of the dark ages and into the light! It outshines the competition to deliver what you've been waiting for, **right now**: true interoperability across diverse environments and integrated production control with vital system activities throughout the enterprise. And here's another bright idea: it does all this from one, easy-to-use graphic interface—from anywhere in the world.

A fully integrated solution, Enterprise Production Management consists of production scheduling and automated systems operations from one central point of management. It rises above other solutions to deliver interoperability you can rely on. It gets shining reviews from users at Fortune 500 companies worldwide.

Don't be left in the dark. Enter the New Dimension in distributed computing. For more enlightenment on Enterprise Production Management, give us a call.

The dangers of CIO turnover

Stories about the short corporate lives of chief information officers have regularly appeared in magazines for years. The information systems press commonly cites turnover rates of between two and three years.

By now, many IS professionals may shrug off CIO turnover as a fact of life that has little impact on their companies or careers. But turmoil at the top of the IS ladder is an important problem.

In the story about the three little pigs, the rationale for building a house out of straw is a short-term perspective. If CIO careers continue to be brief, firms can expect to operate with similarly flimsy systems.

It takes at least seven years to build a long-lasting, low-maintenance systems architecture. The planning cycle may extend well beyond 10 years in firms where the burden of maintaining legacy applications consumes most resources. It is impossible to maintain the necessary long-term perspective in firms where CIOs regularly come and go. Whether CIOs leave due to retirement, promotion, transfers, dismissal or exhaustion is immaterial. What matters is the sense of insecurity that occurs when commitments from leaders are expected to be short-lived.

Furthermore, instability at the CIO level is likely to accelerate the outsourcing of IS support services. It reinforces the prevailing tendencies toward chaotic solutions to systems management problems, such as frequently swinging from centralization to decentralization, trashing

then rebuilding designs and looking to outsiders for know-how that should be homegrown.

With consequences such as these, everyone in IS should be concerned with CIO turnover.

THE SURVEYS

When tracing the origins of these statistics, I always ended up with three surveys: one from a major consulting firm and two from recruiting consultants.

In each instance, the average time a CIO held a job was either 25 or 28 months. A fourth survey, a recent study by Computer Sciences Corp. [CW, April 15], suggested that a CIO's time on the job may be somewhat longer, about 34 months.

The 1994 *Computerworld Premier 100* survey also examined the question of CIO longevity. It concluded that the mean time CIOs held their positions was 6.1 years, with a median of four years. (There was one CIO who has been on the job for more than 25 years — clearly a candidate for a medal.) The Premier 100 were the best of the Fortune 1,000 in terms of information productivity

and therefore not a representative sample. Nevertheless, I couldn't believe that the differences in job longevity between the U.S. average and the Premier 100 firms could be very large.

TAKING NAMES

I happen to have a good way to find out the CIO turnover rate. I have independently validated mailing lists of CIOs from 1994 and 1995. By merging the lists, I could see which names remained the same. From a list of 496 firms, only 232 names showed up in both years. Seventy-four firms changed CIOs in one year. That yields a turnover rate of 24.2%, or an average tenure expectancy of 30 months.

Of the remaining firms, 81 didn't list a CIO for either year. The fate of the CIOs at the other 109 firms is anyone's guess. The names of the CIOs were listed in one year but not the other. I have good reason to believe, based on random spot checks, that about half of those firms have replaced their CIOs without listing the newcomers' names. If that estimate is correct, the consultants' and recruiters' findings of 25-

to 28-month terms is right.

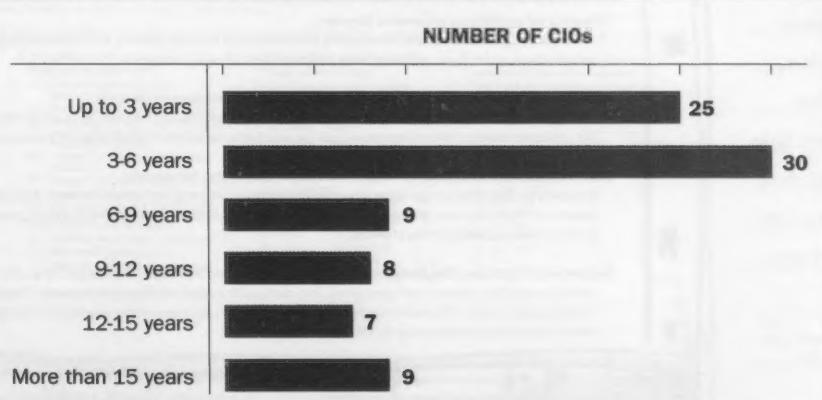

Many say the role of the CIO is to safeguard, develop and enhance a firm's information assets. That suggests CIOs should be in positions to make lasting commitments to build information infrastructures and develop talented systems people. But long-term commitments and short job tenures are inconsistent. In fact, the indifference of many CIOs toward the year 2000 problem is evidence that they didn't expect to be around and accountable for the predictable disaster that will surely befall their systems.

Such a casual attitude toward systems management is a telling symptom of the CIO turnover phenomenon. High CIO turnover reinforces a managerial attention-deficit disorder that makes our information technologies far less effective than their potential. ■

Strassmann held two corporate CIO jobs for four and nine years, respectively. He can be reached via E-mail at paul@strassmann.com or through his home page at www.strassmann.com/.

How long on the job?

Eighty-eight CIOs from the 1994 *Computerworld Premier 100* survey were asked how long they've been in their current jobs. Thirty-three have stayed put for at least six years.

In Depth

Discussion database

By Tim Ouellette

You could say the first groupware was fire. After all, it allowed people to gather, discuss common concerns and work together. In the computer age, technology has improved on most of these capabilities.

Lotus Development Corp.'s Notes is recognized as the first all-inclusive commercial groupware product. Beyond that, there is very little agreement about groupware. It isn't like a word pro-

What is groupware? (5 responses)

Communication (*Ian Campbell, analyst, International Data Corp., Framingham, Mass.*)
Groupware is software that helps you in your daily business activities. These can be boiled down to three areas: communications, managing workflows and accessing knowledge bases. The key is, we all do these things to different degrees. So when you look at each group in an organization, it may not necessarily be the same tool.

Depends on context (*Geoffrey Bock, analyst, Patricia Seybold Group, Boston*)
The definition of groupware depends on the context. As a practical business matter, we need to understand when it's appropriate to make a telephone call, or send a fax, or get together face-to-face, or send an E-mail, or participate in a discussion database. The last thing people do is go and buy groupware — they buy tools and environments to improve their organizations.

Cooperative network (*Joel Snyder, senior partner, Opus One, Tucson, Ariz.*)
Call it a computer-supported cooperative network. With groupware, the productivity gains are there. It is worth it. Almost any investment in groupware will pay off unless you botch it. But you can't just roll it out like you roll out [Microsoft] Excel.

Lotus Notes (*Eldon Greenwood, product manager for GroupWise, Novell, Inc., Orem, Utah*)
The immediate response of many customers is, "Lotus Notes."

Working as a group (*Steve Weissman, president, Kinetic Information, Waltham, Mass.*)
Groupware is software that facilitates working as a group. The problem is the various functions do not lend themselves to pretty categories. Lotus invented a great thing with Notes. But the technology has advanced to a point where the market took that definition and tossed it out the window.

What challenges does the groupware market face? (4 responses)

Throwing out anything as groupware (*Snyder*)
The industry right now is throwing out anything that runs over a LAN as groupware. In some ways, they [new groupware products] are valuable tools, and in some ways they take a bad paradigm and make it worse.

Market hasn't matured (*Gary Rowe, principal, Rapport Communications, Roswell, Ga.*)
The market hasn't matured; products haven't matured; applications haven't matured. You can't find that many products off the shelf, so the application development environment is still important. It is really more of a tool set put in the hands of users.

Hard to pinpoint (*Heidi Dibble, senior business analyst, Cargill, Inc., Minneapolis*)
Groupware is becoming a major piece of our communications. We are going through the effort of focusing on what is groupware and what is not. There are many great areas [such as sales force automation] that kind of overlap with groupware. We are finding that drawing any hard lines is pointless on top of difficult.

Supports small groups (*Alan Barson, manager, Coopers & Lybrand's Strategic Technology Group, Stamford, Conn.*)
When [vendors] first came out with groupware, they came out to support small groups of people. They never meant it to leverage enterprise data stores. Groupware needs to come with a way to support one person working with multiple other groups of people. They need to be thinking about leveraging data across groups.

cessor; it doesn't have strictly defined features and capabilities. Different people identify different features — discussion databases, whiteboards, document conferencing, document management, workflow, electronic mail — as groupware.

Because there isn't a specific definition of groupware, what follows is a discussion database of users, analysts and vendors who are considering where groupware is now, how it is best used and where it is going.

Ouellette is Computerworld's senior writer, groupware and E-mail.

How do you get people to use groupware? (4 responses)

Human factor (Mark Mills, volunteer, Dallas Computer Literacy Program)

The human factor is the most important part of a groupware training program, but it is not discussed much. The definition of groupware should be broadened to include telephone conversations and computer-mediated conversations. There seems to be a tendency to do it all with computers.

Cultural Impact (Greg Lobdell, Exchange product manager, Microsoft Corp.)

The challenge with groupware training is that the cultural impact gets down to the heart of a business. Users need an incentive to share information. It goes all the way down to the compensation model, for example, with salespeople. There are ramifications far outside the IS group, as well.

Good search tool (Campbell)

The best thing that will help people share information is a good searching tool. People are more likely to add knowledge because they feel that they can gather that knowledge back. Teach people how to find data first before forcing them to put the data in.

Show them where (Dibble)

We are getting away from a bums-on-the-seat approach to groupware training. We will teach people how to work together and show them where they can find specific information and where they can publish specific information. Even if you have the technology and infrastructure in place, training is the difference between gaining much or losing much from your groupware investment.

What will the Internet do to groupware? (3 responses)

Different kinds of interactions (Bock)

With the Internet, we can send E-mail to anyone in the world. We can begin to do different kinds of groupware interaction across borders.

Concentrate on core technology (Snyder)

World Wide Web technology lets you concentrate on the core technology of your product.

Large knowledge base (Campbell)

What the Internet does for groupware is provide a very large knowledge base for the user. On the intranet level, groupware on top of intranets broadens the ability to deploy groupware in the company. Let people use browsers to interact with it.

Where does groupware go from here? (3 responses)

Operating system (Bock)

The core, vanilla-flavored groupware interaction technologies will wind up in the operating system. What I expect to see in the next year or two are smart time-management environments that go beyond current calendaring and personal information manager software.

Modular (Weissman)

In the future, you will see more modular software. The big winners will be savvy [value-added resellers] that can put it all together for users.

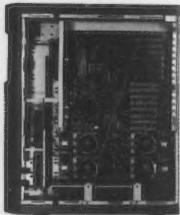

Web browsers (Dibble)

We are developing a strategy [using Web and Notes technology] that is open and flexible. When other groupware tools become available, we can snap them in and out. Web browsers will be our lowest common denominator for groupware.

The company that defined the state-of-the-art in quad processing Pentium technology now takes the server world to the next level. Introducing the **ALR Revolution Quad6**, the first server to offer the power of four 166- or 200-MHz **Pentium Pro** chips. With its advanced processing, integrated hardware management

features, and unequalled expandability, this amazing system is re-defining the PC server's role in today's business world.

Engineered specifically for 32 bit, SMP capable operating systems such as Windows® NT, Netware® SMP and SCO® UNIX, the ALR Revolution Quad6 offers superior server technology for transaction processing, inventory management, database queries, and other enterprise-wide applications. It supports four-way memory interleaving, giving this system a data band-

With fifteen available expansion slots, including 8 PCI slots, the Revolution Quad6 offers superior flexibility.

width that rivals costly, proprietary, mini and mainframe computer technology. Combine this wide data path with up to 2-GB of RAM, and you have the ideal solution for any business that needs to gather, analyze, and access massive amounts of data. And with its large, double-wide chassis, integrated security features, and available fault tolerant storage options, the Revolution Quad6 is

also an ideal place to store this data.

InforManager

Safe-guarding all this hardware is ALR's new integrated Server Hardware Management system.

Utilizing an array of built-in sensors, ALR InforManager monitors key environmental data such as processor temperature, fan operation, system voltage, and chassis security. This up-to-the-minute data is then relayed to a touch-screen LCD control panel, so operators can correct system problems before they lead to costly server downtime and component damage.

It's yet another example of the attention to detail and superior quality that is built into every ALR server. Quality that's backed by a industry leading warranty that will take you right into the next century.

The time for waiting is over. Superior server technology is here. To order your ALR Revolution Quad6, or for more in-depth information, contact your local ALR reseller. Or call our toll-free number today.

Computer Careers

Steaming brew

By Candee Wilde

You're a programmer skilled in C and C++. You've mastered application development tools such as PowerBuilder and Visual Basic. Now you're ready to take the next step in your career development. Your best bet, many information systems recruiters and job hunters say, is Java.

Companies are increasingly using the Internet as a front-end tool to tie in to their internal systems. As a result, they are looking for IS professionals who combine traditional IS skills and Internet skills, says Richard Wonder, president of Richard Wonder & Associates, Inc. in New York.

But despite rising demand, competition for the available jobs is also increasing. The following are experiences of some early Java pros:

Java to go

DAVID CHEN

Contractor programmer

Major telecommunications firm

Chen acquired Java skills by downloading development tools from the Internet and practicing at home. He is working as a contractor but is looking for a permanent position. He has experience with Java, Visual Basic, Multimedia ToolBook and Visual C++, as well as Access and Perl programming for World Wide Web page development.

In learning Java, Chen says, "The tutorial from www.javasoft.com has been quite useful, plus the Java Development Toolkit, which has some examples. Learning from other people's programs is the most helpful experience."

Also useful is Gamelan, The Directory and Registry of Java Resources home page on the Web, he says.

Java junkies

JOHN R. CRISWICK

President

The Internet Conveyor Ltd.

As the head of a small consulting and Internet content developer in Ottawa (www.conveyor.com), Criswick says local telecommunications firms are "currently in

a hiring spree for Java developers. There are a few headhunters on the prowl, as well."

Criswick has a bachelor's degree in computer engineering and a master's degree in space physics. He has worked on Internet projects for about four

years. And he cofounded the Ottawa Java Users Group (on the Web at ottawa.jug.org) in February.

"We started the group because we wanted to have a forum for networking with other Java professionals in the region," he says.

Demand for Java skills is hotter than ever. It's easy to learn, and it's heating up the competition.

Java on the side

JOHN SHIPLE

Interface designer

Construct Internet Design

Even though he isn't really job hunting, Shiple says potential employers have expressed an interest in his Java skills after he posted his name on several message boards "on a lark."

"I read the spec and everything on [Sun Microsystems, Inc.'s] site. Then I practiced a little bit. Voila."

Employers looking for Java programmers prefer people who have other Web-based technical skills — people who have been webmasters or systems administrators, Shiple says. He recommends having knowledge of Common Gateway Interface programming and database skills.

Brewing their own

PETER TITTLER

Vice president of networks and technology

Avis Car Rental, Garden City, N.J.

Tittler says the car rental giant is training a handful of in-house programmers to use Java. Avis IS managers believe Java will ultimately be significant, but Tittler says the company has no plans to hire new programmers to meet the company's needs.

"Assuming our requirements don't outstrip our programming capabilities, we'll do it in-house," he says.

Overall, Tittler says, publicity about Java seems to be moving faster than real-life developments.

Although Java offers exciting possibilities, he says, people tend to forget "that it's only been around a few months. We don't have a suite of applications. If you go out on the Internet, great Java applications are very minimal." ■

The recruiter angle

Jim McClure, vice president and partner at the executive search firm Kom/Ferr International in Boston:

"Most CIOs can't get enough of Java programming. There is a huge need for the education and development of these players," McClure says.

But McClure advises Java professionals to be prepared for some competition. Job hunters who have Java skills are "trying to sell themselves every which way from Sunday," he says.

Brad Williams, senior consultant at Winter, Wyman & Co. in Waltham, Mass.:

"Originally, the need for Java people came from Internet service providers or companies doing business on the Internet," Williams says.

"That changed at the beginning of this year. Now, the companies looking for Java skills range from publishing firms to telecommunications companies to insurance companies. It's across the board."

Diane Porter, senior technical staffing specialist at the recruiting firm Lindenbergs & Associates, Inc.:

"In Houston, the demand for Java programmers and other [Web]-related skills is at a moderate level," Porter says. The reason: The oil and gas companies are "slower to use the technology. But the demand is increasing as more people are educated about its possibilities."

Porter says most Java positions require someone with experience in Hypertext Markup Language, Common Gateway Interface and Web page design, "not just straight coders." Pay ranges from \$35 to \$55 per hour for consultants, she says. Her advice for Java job seekers? "Right now, be flexible about the projects you take on. Most projects now will probably be short in duration, but the experience will go a long way."

Wilde is a freelance writer in Easton, Conn.

Computer Careers

WORK IN DENVER... PLAY IN THE ROCKIES!

Interactive Business Systems, Inc., founded in 1981, is an international consulting firm with offices in 11 U.S. cities and the United Kingdom. Our award winning, full-service consulting firm has over 700 consultants and we're continuing to expand. If you work hard, like to play hard, are looking to challenge your expertise and would enjoy a fabulous location with the Rockies as your playground, then IBS wants to hear from you!

As our tremendous success continues, we are staffing all areas of technical expertise. Must possess a minimum of 2 years experience. All positions are on *Salaried or Per Project Basis*. Currently, we have special interest in the following:

- AIX/C OSF
- INFORMIX/UNIX
- POWERHOUSE
- UNIX/BORLAND C++/MFC
- PC DEVELOPERS/MFC/RB/VIS C++
- ON-LINE HP-UX/PC HELP DESK
- NETWORKING/NT/95
- SR. & JR. UNIX SYS. ADMINS.
- UNIX TEST SCRIPTS & TOOLS
- C+ WINDOWS or UNIX
- COBOL/D82
- TCP/IP TECH SUPPORT
- MAINFRAME/PROGRAMMERS
- TANDEM S/W ENGS.
- 9-1-1 SPECIALISTS
- ORACLE FORMS
- REXX/PYTHON PROGRAMMERS
- MENTOR GRAPHICS

For immediate consideration, please contact: Mandy, **INTERACTIVE BUSINESS SYSTEMS, INC.**, 300 Union Blvd., Ste. 230, Lakewood, CO 80228. PHONE: (303) 985-1166 or 1-800-555-IBS. FAX: (303) 985-1113. (EOE)

Interactive Business Systems, Inc.
Denver, Chicago, Milwaukee, Cincinnati,
Columbus, Dallas, Atlanta, Detroit, London

EXCEPTIONAL EXECUTIVES

The leading high-tech, retained search firm in the Washington DC metro area is seeking uniquely talented leaders to fill these positions for Fortune 200 clients in our area.

Director level position for Operations: Will manage an in-house, integrated platform set that includes SUN, DEC, Alpha, NEXT, Tandem, IBM mainframes and minis, and Intel. Must be technically strong in UNIX and SUN/Solaris and have at least 5 years of client server experience. The challenge is to standardize and automate the process. Will manage a staff of over 50 people, including Directors, Managers and top technical talent. Total comp in the \$150k range.

Director level position for Networking for the multi-platform environment above. Protocols include ATM, FDDI, TCP/IP, IPX, Token Ring, and Ethernet. The key is to have an excellent perspective on day-to-day operations, implementation and emerging network technologies. Will manage a staff of over 20 people and be both technology and business sensitive. Total comp in the \$150k range.

Senior Manager of Technical Operations: Will direct the efforts of three groups: a 24x7 UNIX/SUN OS and Solaris Data Center, a Level 2 PC & Windows, phone-in Help Desk and a telephony (DOS/DS3) Inbound and Outbound communications capability. The key challenge is to manage a staff of 15-20 to take individual responsibility, resulting in a smoothly running document store and forward service. Total comp to the low \$80s.

For immediate consideration, please send or FAX your resume to:

DBA'S AND PROGRAMMER ANALYST

Big "B" Drugs, a major drug retail chain in the southeast, is currently seeking IS professionals with experience using CICS and DB2 in a UNIX and/or MVS environment. Qualified candidates will have a minimum of 3 years experience. Degree preferred but not required.

The DBA candidate must have experience in the logical design of a relational data base. Experience in DB2, DB2/2000 and DB2/2 in a cross-platform environment using DB2/DCP preferred.

The PROGRAMMER ANALYST must have experience in both batch and on-line programming applications using a relational data base.

Interested candidates should forward their resume and salary history to:

Jim Barton
Director of Application Development
Big B Inc.
P.O. Box 10168
Birmingham, AL 35202

PROGRAMMER ANALYST (5 openings) (Ref: 8011017)

Consult with clients to ascertain

& define their business requirements or problem areas & utilize

technical expertise to provide

solutions to clients. Analyze, de-

sign, develop & imple-

ment computer software for

client EDI systems; analyze,

design, program, implement,

prototype, enhance, maintain,

program, test, debug, benchmarking & performance

tuning of ORACLE, UNIX &

Computer Careers Midwest

SYSTEMS CONSULTANT/ ALTERNATIVE BANKING SYSTEMS

Key Services Corporation, a wholly-owned subsidiary of KeyCorp, has openings in our Cleveland location for Systems Consultants to become a member of our alternative banking systems team. You will provide consulting services in the system; engineering and/or systems analysis functions. Excellent technical skills in programming direct talk/6000 platforms utilizing the GUI interface application builder and "C" language programming skills.

Bachelor's degree and extensive programming experience required, telecommunications skills and knowledge of computer/telephone integration concepts, familiarity with CICS based systems.

Key Services is rated as one of the Best Places to Work by Computerworld magazine. Excellent salary and benefits package included. Please send resume to:

Key Services Corporation
Human Resources/AD
2025 Ontario Street
Mailcode: OH-01-01-0102
Cleveland, OH 44115

E-Mail: KSCRecruit@KeyCorp.e-mail.com

An Equal Opportunity Employer M/F/H/V

PROGRAMMER ANALYST [2 openings] - plan, develop, test & document comp. programs, applying knowledge of programming techniques & comp. systems; evaluate user request for new or modified programs; determine feasibility, cost & time req'd., compatibility with current sys. & comp. capabilities; convert operating procedures & clarify program objectives; formulate plan outlining steps req'd. to develop program using logic & flowcharts & convert project specifications, using flowcharts & diagrams into sequence of detailed instructions & logical steps for processable by comp. Responsibilities include process modeling, unit & integrated w/ testing, and unit testing. Req'd. exp. & ed. as a Programmer Analyst, Programmer Analyst, Sys. Analyst, Software Engr., Consultant, Project Executive. Will accept 3 yrs. of comp. exp. plus 3 yrs. exp. in the job offered or in a related occup. in lieu of the req'd. exp. Must have some knowledge of business systems, software design, development & usage of each of the following: DEC VAX/VMS, PRO-IV, Prokit, Pascal & C, C++, COBOL, Fortran, Pascal & C, \$44,500/yr. 40 hrs/wk., 8:30a-5p, M-F. Send resume to 7310 Woodward Ave., Rm 415, Detroit, MI 48202 & include Ref #68198. Employer Paid Ad.

Programmer Analyst (Oakbrook, IL): Dg/dv/bp/imppnt business applicn systems using RDBS such as Oracle & Sybase & front-end tools such as PowerBuilder, C & Oracle or Informix. Must be familiar with Windows Front and machines. Analyze applicn & perf. dbase modeling using CASE tools such as Erwin & Oracle. C, C++, COBOL, Fortran, Pascal & C, \$4K/yr. Req: BS-Comp Sci or Comp Eng, 2yr exp in job offd. Must be willing to travel to client sites for short durations. Must have prior legal authority to work permanently in U.S. Send resumes to: Illinois Department of Employment Security, 401 South State Street - 3 South, Chicago, Illinois 60605, Attention: Ref ID: 14975-K. An Employer Paid Ad. No Calls - Send 2 copies of both resume and cover letter.

Computerworld's 1995-96 Salary Survey is Now Available on Disk!

What are other IS managers paying their staff?

Are you offering competitive rates?

Which industries are paying top dollar?

Answer these questions and more with Computerworld's 6th Annual Salary Survey on disk, where compensation for 28 information systems positions is covered in 28 industries.

All this for just \$399.
Call today! 1-800-495-0257

Software Engineer: Will create and develop appropriate software to be used for purpose of automated machine processes including specifications of appropriate software documentation. Will create Graphic User Interfaces to allow process control and monitoring. Will create an Intelligent Front End System software package for creation of interface between machine and fiber placement machines and appropriate machine functions. Will create appropriate data calculations and massive calculations functions to generate appropriate code to analyze. Software engineer to insure integrity and accuracy of fiber placement functions of automated machines. Will perform work in the field on an IBM/R6000 and HP7000. Will use project data to generate numerical control files using Offline Programming System. Requires M.S. degree in Software Engineering or Electrical Engineering. Also requires six months experience in the job to be performed or six months experience as an Assistant Engineer. If experience in related field, entire experience must include design, implementation of a real time control system using digital signal processing technology including system implementation, power management, education. Education to include completion of one course in each of the following: Advanced Engineering Math, Digital Image Processing, Parallel and Distributed Processing, Neural Networks, and Object-Oriented Design. Education to include completion of one project in which the individual designed and implemented neural network systems to perform image processing and pattern recognition in a UNIX environment. Experience to include completion of one project in which the individual designed and implemented a Graphic User Interface for a data acquisition database system. 40+ hours/week at \$38.570.00 per year salary. Must have proof of legal residence to work permanently in the U.S. Req'd. exp. & ed.: Illinois Department of Employment Security, 401 South State Street - 3 South, Chicago, Illinois 60605, Attention: Ref ID: 14975-K. An Employer Paid Ad. No Calls - Send 2 copies of both resume and cover letter.

PROGRAMMER ANALYST [2 openings] - plan, develop, test & document comp. programs, applying knowledge of programming techniques & comp. systems; evaluate user request for new or modified programs; determine feasibility, cost & time req'd., compatibility with current sys. & comp. capabilities; convert user to identify current operating procedures & clarify program objectives; formulate plan outlining steps required to develop program using structured analysis & design; convert project specifications, using flowcharts & diagrams into sequence of detailed instructions & logical steps for processable by comp. Responsibilities include process modeling, unit & integrated w/ testing, and unit testing. Req'd. exp. & ed. as a Programmer Analyst, Programmer Analyst, Sys. Analyst, Software Engr., Consultant, Project Executive. Will accept 2 yrs. of comp. exp. plus 2 yrs. exp. in the job offered or in a related occup. in lieu of the req'd. exp. Must have some knowledge of business systems, software design, development & usage of each of the following: DEC VAX/VMS, PRO-IV, Prokit, Pascal & C, \$44,500/yr. 40 hrs/wk., 8:30a-5p, M-F. TOUCH THE FUTURE TODAY!

When you think of Allstate, envision a state-of-the-art information technology provider. At Allstate, we understand that our future is enabled by technology, and we intend to maintain our position on the leading edge. Allstate will provide you with:

- The latest technology
- The opportunity for professional advancement
- The challenge of change housed in the continuity of a stable corporate environment
- Very generous compensation and benefit package

There is only one way for you to touch the future today - by joining the Allstate Information Technology team. Allstate operates in ORACLE 7.0 and DB2 environments. We currently have openings from entry to senior-level positions at our four locations: Northbrook, South Barrington, Arlington Heights, and Mundelein. We are aggressively recruiting for the following positions, all of which require a bachelor's degree in computer science or a related field.

APPLICATION DEVELOPMENT

Requires experience with Windows-based client/server development using RDBMS, GUI development tools, PowerBuilder, C, C++ and Microsoft Office toolkit. Positons also available for candidates with COBOL experience in a mainframe environment.

DATA ADMINISTRATION

Experience with Information Engineering methodology and/or CACI leads a must. RDBMS experience with ORACLE or DB2 required. Requires logical data modeling skills, relational data management, and decision support systems experience.

DATA WAREHOUSE DESIGN

Requires experience with relational database design, relational database, data modeling technique, CASE tools, and decision support skills.

OBJECT-ORIENTED PROFESSIONALS

Requires experience in object technology including methodology analysis and design, Smalltalk application development, GUI design, class library design and distributed systems.

TELECOMMUNICATIONS ENGINEERS

Minimum of 5 years experience in a network environment using Token Ring and/or Ethernet topology. Experience with analysis, design, implementation of large scale networks, including: IPX/SPX, SNA, TCP/IP, Novell Network, and Windows NT Server, etc.

PERFORMANCE MANAGEMENT

Manage performance, tune and plan for a CICS, COBOL application online/batch cycle; knowledge of SAS, Strobe performance analysis tools, MVS, VSAM, JCL, COBOL/COBOL II, CICS.

TECHNICAL SUPPORT SOFTWARE PROGRAMMERS

Responsible for OEM vendor product installation and CICS support functions. Responsible for migration, configuration, maintenance and support in an MVS 5.1 Sysplex environment utilizing CICS 4.1 PTS architecture. Knowledge of SPF and JCL is required. Minimum of 3 years experience is desirable.

Allstate offers an exceptional compensation package consisting of life, medical, dental and vision insurance plans, a company pension plan, 401(k) profit sharing plan, and Work/Family Benefits including child/elder care, adoption, and education planning and assistance, employee assistance program, flexible spending accounts, legal plan care plan, long-term care and tuition reimbursement.

If you're a person who thrives on change and is stimulated and motivated by the first-time challenges that occur in a growth environment, then...being in good hands is the only place to be. Touch your future today - e-mail or fax your resume to: <http://jobs@allstate.com>; or mail/fax to: Allstate Insurance Company, Information Technology Selection Team, 2775 Sanders Road, Suite A-1, Northbrook, IL 60062. Fax: (847) 402-9696.

Allstate is an equal opportunity employer and we encourage men, women, the disabled and veterans to apply.

CAREER opportunities

...are awaiting you at

Blue Cross and Blue Shield of South Carolina.

Due to rapid growth, we are currently accepting resumes for several positions presently vacant. Several Programmer/Programmer Analysts and Systems Analysts, all positions are located at our Columbia, SC office.

Information Systems Network Engineer: Work experience required of at least 7+ years in one or more of the following: OS2, TCP/IP, UNIX, Windows 95, Windows NT, LAN Server products, SNA, and Novell. Previous experience in CISCO Routers, as well as network management in a Token Ring environment and an in depth knowledge of PCs is required. PC programming a plus.

Programmer Analyst: Successful candidate must have the following skills: mainframe cobol/cobol II, JCL, and/or COBOL, and/or PL/I, COBOL, and/or CICS, and/or DB2, and/or OS2, and/or UNIX, and/or TCP/IP, and/or SNA, and/or Novell, and/or CISCO Routers, and/or PC programming a plus.

LIMITLESS CAPABILITIES & Endless Possibilities

NCR has built a solid reputation by providing world-class computer products and services. Our belief in nurturing strong customer partnerships, providing state-of-the-art products, and valuing each of our employees has made us a leader in Data Warehouse Solutions, the #1 vendor in the Massively Parallel Processing Market, and the market leader in the medium scale UNIX Market. As we continue to build an even stronger presence, we seek professionals who can make a difference in our future and the future of our clients.

ENTERPRISE SYSTEMS SALES

NCR is the industry leader with over 10 years' experience designing, implementing, and managing Data Warehouses for Fortune 50, 100, and 500 companies. NCR's WorldMark™ is recognized as the industry's leading SMP and MPP server platform.

NCR is seeking professionals for opportunities in Atlanta, Boston, Chicago, Cincinnati, Milwaukee, New York City, St. Louis, Washington, DC, and Florida.

LARGE SYSTEMS COMPUTER SALES SPECIALISTS

Selected candidates will plan and execute WorldMark™ server sales for named accounts. Must have large systems computer and solution sales experience, as well as knowledge of industry IT trends. Knowledge of Decision Support Systems (DSS) and relational databases (DB2, Teradata, Oracle, Informix, and Sybase) desired. Specific industry experience preferred, but not required.

Successful candidates must have major account sales experience; consistent sales achievement over quota; excellent communication, negotiation, organization, and planning skills; and experience working in a team environment. Job Code CSS

TECHNICAL ACCOUNT MANAGER

Selected candidates will act as the technical strategist for sales teams, and will be the focal point for and coordinate all technical issues for named accounts. Must have experience in Data Warehouse and transaction processing applications, and technical consulting and support experience. Specific industry experience preferred, but not required.

Successful candidates will have sales experience and consulting abilities, as well as excellent communication and presentation skills. Technical degree preferred. Job Code TAM

#1 IN DATA WAREHOUSING

DATA WAREHOUSE CONSULTING

Successful candidates will have professional consulting abilities, excellent interpersonal skills, an innovative approach to problem solving, the ability to work in a virtual environment with a team orientation, and a strong commitment to quality and customer service. Bachelor's degree desired. Master's degree preferred. Willingness to travel required.

Our rapidly growing practice is seeking professionals for opportunities in Atlanta, Boston, Chicago, Dallas, New York City, Philadelphia, Washington, DC, and Toronto.

DATA WAREHOUSE SENIOR CONSULTANTS

Qualifications include proficiency in Logical and Physical Data Modeling and design, as well as familiarity with MVS and UNIX, Data Transformation/Migration tools, relational database technology (DB2, Teradata, Oracle, Informix), GUI development tools, and developmental project plans in an application development environment. Big 6 or equivalent experience is strongly desired. Job Code SC

DATA WAREHOUSE PROJECT MANAGERS

Selected candidates will develop project proposals, recommendations, action plans, and budgets. 6 years' progressively responsible IT experience encompassing staff/team management, as well as project management and consulting experience required. PMI certification preferred. Job Code PM

NCR offers a competitive salary incentive bonus, and generous benefits with an exceptional opportunity to grow and learn in a new and challenging environment. For confidential consideration, please send or fax resume, indicating position of interest, to: NCR, Job Code (indicate appropriate Job Code), 6870 Koll Center Pkwy, Pleasanton, CA 94566; FAX: (510) 417-1886. An Equal Opportunity Employer. Job Code SC

New infrared connections bring huge throughput gains

By Chris DeVoney

As barriers to speed drop, infrared technology is gaining an increased role in connectivity.

Users and information systems departments for years have fought the classic problems associated with portable computers: installing large applications, moving working files, synchronizing desktops and notebooks and disrupting cables to print files from notebooks.

Notebook manufacturers offered infrared ports as a solution. Operating at serial port speeds of 115K bit/sec., notebooks could wirelessly send jobs to a printer or exchange files with a desktop.

Though convenient, infrared connections were generally considered too slow. IBM pioneered the first 1.2M bit/sec. infrared ports, which let ThinkPad notebooks communicate eight times faster, but only among themselves. Desktop receivers, which connect to the serial port of the printer or desktop computer, still topped out at 115K bit/sec.

Recent advances raise the ante. Hewlett-Packard Co.'s Netbeam IR (\$299) and Extended Systems, Inc.'s JetEye Plus (\$349) are network-compatible infrared devices that connect any portable to a 10Base-T or 10Base-2 Ethernet LAN. Token Ring will follow this summer. Support for Infrared Data Association (IRDA) standards for hardware, operating systems and applications software communications makes the connection transparent. The 4M bit/sec. data rate of the network adapters (about the same as a double-speed CD-ROM drive) and recent high-end notebooks makes

the connection speed practical.

We conducted several tests in which we used three notebooks: a Gateway 2000, Inc. Solo 90 that uses a standard 115K bit/sec. infrared port, an IBM ThinkPad 760 with a 1.2M bit/sec. port and an HP OmniBook 5500 with a 4M bit/sec. port.

The difference between wired and wireless connections when printing typical letter-size documents or graphics-laden pages on an HP DeskJet 340 or LaserJet 5P was negligible. The difference came when printing long documents on the LaserJet. With a 20-page document, the parallel connection was twice as fast as the infrared connection. But the wait was manageable because the report took less than five minutes to print.

The wait for copying files depends on the connection and the software. With the Netbeam IR or JetEye Plus on a Windows NT and Ethernet network, it took about six minutes to copy a 12M-byte movie clip from a ThinkPad to a networked desktop system. The OmniBook took less than a minute, a tribute to its faster port. But Windows reported that the Solo would take 59 minutes.

Though you may be able to cut the cable, infrared connections have several rough spots. They are limited to about 5 feet and follow a line-of-sight path. Cluttered desks are the bane of infrared, and the location of infrared ports on the notebook is important. The ThinkPad conveniently locates infrared ports on the front and back sides. The port on Digital Equipment Corp.'s HiNote is on the right side, an awkward location on most desks for making a connection.

The plug-and-play feature of Windows 95 and Windows NT 4.0 doesn't cover the multistep installation of

IRDA drivers. Reading the highly legible manuals solves this problem. Manually restarting the infrared network connection on the notebook each time Windows restarts can be annoying.

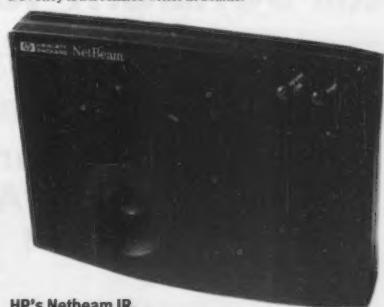

Software that automatically synchronizes the notebook and desktop, such as Traveling Software, Inc.'s Laplink and Puma Technology, Inc.'s TranKit Pro, has somewhat clumsy user interfaces but is much better than the almost-worthless Windows 95 Briefcase.

Despite the bumps, infrared is an attractive alternative to hard-wired cables, docking stations and PC card network adapters. Colleges and companies can offer printing ball pens for notebook users. As more notebooks incorporate 4M bit/sec. ports, making the corporate LAN connection will become natural. ■

DeVoney is a freelance writer in Seattle.

Infrared devices

HP's Netbeam IR, like Extended Systems' JetEye Plus, moves data from portables at up to 4M bit/sec.

Announcing the first world-class conference on intranets

June 24th - 26th • The Fairmont Hotel • San Jose, California

COMPUTERWORLD's

intr@net '96 Conference

This exclusive, world-class conference on intranets — internal Webs and the enterprise — is an interactive, two-day forum in which CIOs and industry leaders will discuss and formulate their agendas for the corporate growth of intranets. Presented by *Computerworld*, the leading weekly newspaper for information systems management, and sponsored by Netscape and its business partners Booz-Allen & Hamilton, Compaq, Informix, and Sun Microsystems, this conference will set the agenda for the growth of corporate intranets in the '90s.

Come hear the following speakers:

- "Taking Intranets to the Next Level" **Jim Barksdale**, *Netscape*
- "Java and the New Order of Network Computing" **Eric Schmidt**, *Sun Microsystems*
- "The Future of Information Management for the Intranet" **Richard Williams**, *Informix Software*
- "The Future of the Intranet Web" **Ronald Ward**, *Compaq*
- "The Real Time Marketplace" **Regis McKenna**, *Gemini McKenna*
- "The Electronic Enterprise and the Intranet" **J.M. Tenenbaum**, *CommerceNet*

Computerworld's intr@net '96 conference was designed by *Computerworld* and Tenex Consulting, a general management consulting firm providing strategy, business improvement and information technology services.

CIOs interested in attending Computerworld's intr@net '96 should call (800) 340-2366 to be pre-qualified. Participation in this June event is strictly limited. We expect a sold-out conference. So call today!

CIOs and industry leaders slated to attend Computerworld's intr@net '96 as of 5/23/96:

Barry Silverman, Aluminum Company of America
Jerrold Grochow, American Management Systems
Spencer McMurray, Avon Products
Raymond Pyle, Blue Cross & Blue Shield Assoc.
Charles Callahan, Booz-Allen & Hamilton
Christopher Dallas-Freney, Booz-Allen & Hamilton
Charles Lucier, Booz-Allen & Hamilton
Tom Logan, Chevron
Susan Unger, Chrysler Corporation
Doug Harman, Citibank
Paul Weinberg, CIGNA
J.M. Tenenbaum, CommerceNet
Jeff Erramouse, Compaq
Tejas Vahil, Compaq

Have a Problem With Your Computerworld Subscription?

We want to solve it to your complete satisfaction, and we want to do it fast. Please write to:

COMPUTERWORLD, P.O. Box 2043, Marion, Ohio 43305-2043.

Your magazine subscription label is a valuable source of information for you and us. You can help us by attaching your magazine label here, or copy your name, address, and coded line as it appears on your label. Send this along with your correspondence.

Address Changes or Other Changes to Your Subscription

All address changes, title changes, etc. should be accompanied by your address label, if possible, or by a copy of the information which appears on the label, including the coded line.

Your New Address Goes Here

Address shown: Home Business

Name _____

Company _____

Address _____

City _____

State _____

Zip _____

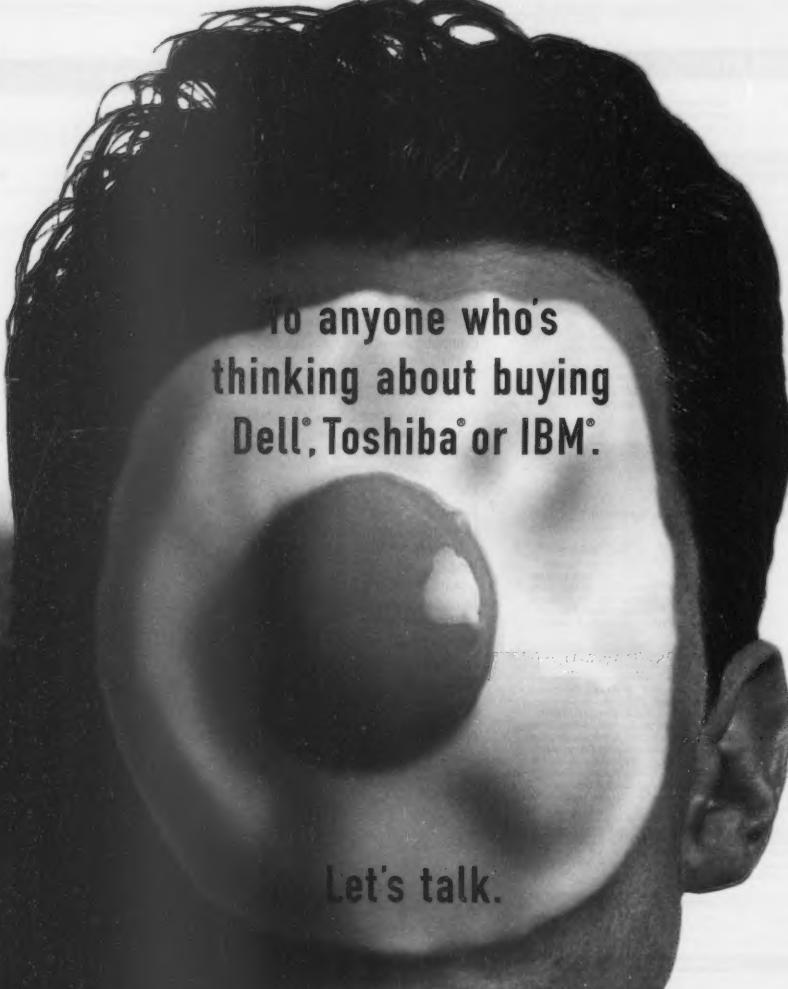

Other Questions and Problems

It is better to write us concerning your problem and include the magazine label. Also, address changes are handled more efficiently by mail. However, should you need to reach us quickly the following toll-free number is available: 1-800-669-1002 Outside U.S. call (614) 382-3322. CompuServe members can reach us at account number 73373, 1230. Internet address: circulation@cw.com

Comments: If you have comments or suggestions for us, or if you would like to receive a copy of our newsletter, "Computerworld News," please write to the following address - COMPUTERWORLD, Circulation Department, 500 Old Connecticut Path, Framingham, MA 01701.

pentium®

To anyone who's
thinking about buying
Dell®, Toshiba® or IBM®.

Let's talk.

How embarrassing. You buy a new notebook, then find out you could have had better. Or paid less. Or both. The AST® Ascentia™ P, on the other hand, is packed with some of the hottest technology around—from a 133 MHz Pentium® processor to our swappable SmartBay drive. Yet it still has a starting price of just \$3499**. You'll even get the personal attention of a reseller and AST's 24-hour support. So with the Ascentia P, the only thing on your face will be a big, fat smile. Call 800-876-4AST, or visit <http://www.ast.com>.

Ascentia P 100 - 133 MHz Pentium processors, 12.1" or 11.3" diagonal SVGA TFT screens**, up to 40 MB RAM, SmartBay modular 6X CD-ROM and floppy drive, SmartPoint™ Touchpad and Lithium Ion battery.

© 1998 AST Research, Inc. All rights reserved. AST, the AST logo, Where Things Are Happening, Ascentia and SmartPoint are trademarks of AST Research, Inc., Intel and Pentium are registered trademarks, and the Pentium Processor logo is a trademark of Intel Corporation. StreetWare

Chuck Phillips

Looking for an encore

Over the past five years, the three leading database companies have made a lot of money for investors. But recent financials from some of these companies have been uninspiring. Sybase, Inc. (Nasdaq:SYBS) reported a loss in its latest quarter, and Informix Corp. (Nasdaq:IFMX) is smarting from two consecutive quarters of light U.S. revenue growth.

Is the hot streak ending for the data kings?

No, but it's about to change dramatically. The inexpensive online transaction processing (OLTP) engines that have brought these firms so much success have become commodities.

Today, all three vendors' products

can create, read, update and delete records reliably and quickly.

Data warehousing will help, although it's still less than 10% of the OLTP market. Its rising popularity will prompt the sale of new database licenses. But to sustain the 40% growth to which investors have become accustomed, the database companies have to find something else to store besides structured data, which makes up only 20% of all business data. Consequently, they are rushing to build "universal servers," databases that store audio, video, spatial and other types of data.

As World Wide Web pages evolve, these new data types will become common. After all, why look at a text description of a part on order when you can view it and rotate it?

Informix has the most innovative universal server technology, but Oracle Corp. (Nasdaq:ORCL) has an edge in integration and near-term practicality. The good news for both companies is that Microsoft Corp. (Nasdaq:MSFT) is nowhere in data warehousing and abstract data types and is unlikely to get there any time soon because it will be too busy putting out Web fires for the next three years.

The bad news is that technology transitions rarely happen smoothly. Consequently, we could see growth slow as database vendors push users toward new technology. But assuming users make the leap, we'd bet on Informix and Oracle for years to come.

Phillips is enterprise software industry analyst at Morgan Stanley & Co., a global investment banking firm in New York. He welcomes comments at chasp@ms.com or (212) 761-4450.

Companies duck into SAFE HARBOR

YOUNG SOOK CHO

New law means corporations can make bolder predictions

By Alan R. Earls

Thanks to the passage of the Private Securities Litigation Reform Act late last year, shareholders are hearing more substantial statements from public companies.

The act contains a safe harbor provision that allows companies to release more details about their expectations, as long as the statement includes a disclaimer with "meaningful" cautionary language. The law was designed to protect companies from frivolous shareholder lawsuits, which have been rife in the high-tech industry. According to the American Electronics Association, more than half of the Top 150 Silicon Valley companies have been targets of such suits in recent years.

Companies are already becoming more communicative, according to Bruce Vanyo, head of Securities and Exchange Commission

(SEC) litigation for Wilson, Sonsini, Goodrich and Rosati, a law firm in Palo Alto, Calif. "I've heard that within 30 days of the law's passage, more than 100 companies changed their reporting practices," he says.

George Solman is CEO of one of those companies, Centigram Communications Corp., a maker of audio information processing systems in San Jose, Calif. Because of safe harbor protection, the company has been able to release information about new product development and report product sales.

"Before this, we would have been very strongly advised by our counsel to say nothing," he explains.

Straight talk

Previously, companies were paranoid about releasing any information, says Michael Murphy, editor of "The California Technology Stock Letter" in Half Moon Bay, Calif. "I've gone to some analyst

meetings where the company's executives would just read their press release and go home without answering any questions," he says. In contrast, Sun Microsystems, Inc.'s most recent analyst briefing, for example, was much more candid, he notes.

Yet some say the law's longer-term effect and durability have yet to be proved and that the threat of lawsuits will remain until the law's provisions have been challenged in court.

"It's too early to tell how this law will work out and whether it will really control frivolous suits," says Arthur Patterson, managing partner at Accel Partners, a venture capital firm in Princeton, N.J.

Patterson says smart companies will sit tight until the law is challenged in the courts. Vanyo is also warning corporate clients to remain cautious until courts stabilize the law's interpretation.

Earls is a freelance writer in Franklin, Mass.

They're
every reason
you bought a mainframe.

And
every reason
you didn't.

INTRODUCING
SUN'S NO-COMPROMISE ENTERPRISE SERVERS.
THE FIRST IN HISTORY
TO GIVE YOU MAINFRAME CALIBER COMPUTING
WITH THE BENEFITS OF OPEN SYSTEMS.

You bought a mainframe because of the reliability, capacity, throughput and control. But they lacked the flexibility, information-access and applications of client/server computing. Now, you can have the best of both worlds—the Sun[®] Ultra™ Enterprise[™] Servers combine the benefits of network computing with the capacity, reliability and control of a mainframe to give you an entirely new level of computing. Whether you need immense data warehouses or the ability to support thousands of users, Sun delivers. Up to 30 processors, 30 gigabytes of memory, mainframe-class I/O, and 10 terabytes of storage. And with Solaris[™] operating environment you get the ability to expand in all directions so you can have capacity on demand. Plus, you'll have the confidence of a system engineered with the industry's best reliability features; every major system component is redundant and hot-pluggable. Naturally, these systems are backed by world-class service, and round-the-clock mission-critical support. Factor in Solstice[™] software, a comprehensive suite of tools and services, and you've got centralized control of your entire network. Thanks to our premier software partnerships, these servers are the ideal platforms on which to run all the leading business applications. Sun Ultra Enterprise Servers. The era of enterprise network computing is here. To learn more, contact <http://www.sun.com> or 1-800-786-0785, Ext. 410.

How to contact CW editors

CONTACTING US BY PHONE

All editors can be contacted at our main phone number, (508) 879-0700, unless otherwise noted below. Our **24-hour news tip line** is (508) 820-8555. For subscriptions, call (800) 669-1002; **back issues**, call (508) 820-8129; **reprints**, call (508) 820-8125. Our **main fax number** is (508) 875-8931.

CONTACTING US BY E-MAIL

Our Web address is www.computerworld.com. All of our staff members can be reached via E-mail on the Internet using the form first_name_lastname@cw.com. IDG News Service correspondents can be reached using the form first_name_lastname@idg.com. Subscription inquiries go to circulation@cw.com.

Letters to the editor are welcome and should be sent to letters@cw.com. Please include your address and telephone number.

CONTACTING US BY MAIL

Our postal address is P.O. Box 9171, 500 Old Connecticut Path, Framingham, Mass. 01701.

Respond to our **Talkback** inquiries at talkback@cw.com.

CONTACTING CW EDITORS

We invite our readers to call or write with comments and ideas. It is best to submit ideas to one of the department editors as well as to the appropriate beat reporter.

You, Trying To
Manage An Open
Environment With
Ordinary Storage.

You, Managing
An Open
Environment
With EMC.

Is trying to maintain your open systems tearing you apart? Consider then, centralized, enterprise-wide storage from EMC. Our storage solutions let you consolidate and manage all your information from one place. They're scalable and work across leading platforms for highest performance. Not just with the UNIX and LAN servers you have now, but with those you add down the road. EMC storage also offers powerful protection against the loss of your mission-critical data.

Reliable, cost-effective and centralized, no wonder EMC is the leading supplier of independent storage to the open systems market. For more information on how EMC storage can help you keep it together, call 1-800-424-EMC2, ext. 225. Or visit us at <http://www.emc.com>.

Killer corporate philosophy

Computerworld crossword by Rick Bennett

This unofficial motto was allegedly a stake driven into the heart of a major software player. What's the motto, and who said it?

ACROSS

- 1 Slang for backward
- 6 Mouse milieu
- 9 Mimics
- 13 A kind of seal
- 14 Pallid
- 15 Fertility god
- 16 Expendable aircraft
- 17 — Romeo, car
- 18 Showily imitative of style
- 19 START OF MOTTO
- 22 That which is deserved
- 23 Recurring only at long intervals
- 24 Monetary unit
- 27 Artiodactyl mammal
- 30 Pre-acquisition name of Silicon Valley's Cadence

- 32 Weep
- 33 Source of campaign funds.
- 34 Microprocessor debugging dev.
- 35 Exhibiting vigorous good health
- 36 MOTTO, PART 2
- 41 Herbaceous plant
- 42 Martyr's initials
- 43 The greatest
- 44 Light conversation for social occasions
- 45 One really COMMITTED to your breakfast
- 46 Silicon Valley supplier of network cards
- 49 Wake-up signal?
- 51 Fencing foil
- 54 Ores used in nuclear reactor rods, for short

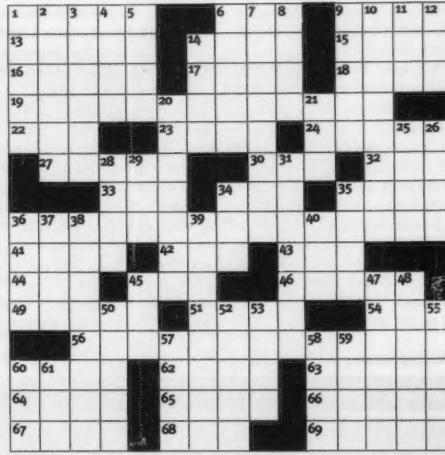

- 56 END OF MOTTO
- 57 and alleged SOURCE
- 60 National capital
- 62 E-mail acknowledgment, abbr.
- 63 She aided Jason in taking the Golden Fleece
- 64 Forever, to a Pentium Pro
- 65 About aviation
- 66 Put up
- 67 Expression of contempt
- 68 Airport luggage tag for creator of 17 ACROSS?
- 69 What one does to a bunch of subroutines

DOWN

- 1 Accomplished again
- 2 Too much noise

- 3 Garden tool
- 4 Gambling town
- 5 A European river
- 6 More of 14 ACROSS
- 7 Outdoors
- 8 Turn a — ear
- 9 Manila hemp
- 10 Devoted to a cause or party

Inside Lines

Second City presents *Citizen Gates*

Bill Gates might have skipped Comdex in Chicago last week, but visitors who wanted to catch a glimpse of the Microsoft chairman could have stopped in at Second City. The famed improvisational comedy troupe that gave John Belushi and Bill Murray their starts was presenting *Citizen Gates*, a humorous send-up of the billionaire software maker. Wearing a baby-blue cardigan sweater and nerdy dark-framed glasses, the Gates character appeared periodically in the dozen or so skits to remind the audience just how rich he was. By the end of the two-hour show, Gates had bought the rights to the color red and made about \$7 million.

Stop spreading the Word ...

Speaking of Microsoft, the company's Office team recently sent out a limited-edition CD-ROM that contains a list of 20 products compatible with the 32-bit Office. Just one problem: Two of the files on the CD-ROM were infected with a Word Macro virus. Microsoft has begun distributing a downloadable Macro Virus Protection file to help users disinfect their systems. It installs a set of protective macros that detect any suspicious Word files and alert network administrators and users.

SCO to launch low-flying Comet

SCO next week will introduce a new version of its low-end OpenServer operating system, code-named Comet, that adds a Novell NetWare 4.X gateway and support for up to 4G bytes of addressable memory. Comet will also include some initial compatibility with UnixWare, the

more enterprise-size operating system that SCO bought from Novell last year. A unified development tool kit for the two SCO operating systems is due later this year.

A Notes sandwich

Industry sources say Lotus is planning announcements at PC Expo next week to bolster the use of Notes as middleware. Lotus wants to link Notes to various enterprise back-end systems so users can have one point of access to data and transactions from these various sources.

The 5th Wave by Rich Tennant

I'm OK; you're OK; my computer is OK

Worried about computer security? Maybe your computers should get in touch with their feelings. At the recent Symposium on Security and Privacy, sponsored by the Institute of Electrical and Electronics Engineers, a university professor presented a paper titled "A Sense of Self for Unix Processors." Self-aware machines can detect suspicious "anomalies" it seems. Other "biologically inspired topics in computer security" included applications of immunology and virology to safe computing.

Problem? What problem?

Sixty-two percent of North American IS executives said their companies are taking steps necessary to deal with the year 2000 date-change issue. But the Olsten Corp.'s survey of more than 300 IS executives showed that 13% of the firms polled were unaware of the pending problem.

Hewlett-Packard's technical support center in Mountain View, Calif., recently logged a heavy load of calls from some remote users who were looking for an entirely different kind of support than the center's workers are used to disseminating. These were users of remote controls for changing television channels, and they were really hoping to chat with Uzo, a Nigerian exotic dancer who has a show on public-access cable TV channels in New York and Los Angeles. Unfortunately, Uzo's accent made it hard to tell whether her chat line's number began with "800" or "900." Callers who chose the toll-free route found HP at the other end instead of the TV hoover. We certainly have no exotic dancers here at Computerworld, but please contact us anyway if you have news tips to pass along. News editor Patricia Keefe can be reached at patricia_keefe@cw.com or (508) 820-8183.

THE FUTURE FOR SOFTWARE DEVELOPERS HAS JUST BEEN UPGRADED FROM HOT TO EXTRAHOT

On March 26th, the world of software development tools got its first taste of the future. Cayenne.

Cayenne Software combines the leadership in data-driven modeling and database design of Bachman Information Systems, Inc. and the leadership in structured and object-oriented modeling resident in Cadre Technologies, Inc. Together, they generated revenues of approximately \$70 million last fiscal year.

This fusion offers developers of technical and commercial applications the industry's most impressive range of scalable development tools to work with as they move forward into object-oriented development and beyond. From a global company potent enough to bring real enterprise power tools to distributed and embedded environments.

To mark the event, Cayenne is turning up the heat with some special offers, including an aggressive competitive upgrade program.

Call us at 1-800-285-7294 or look us up on the internet at
<http://www.cayennesoft.com> for more details.

Cayenne. The right tools at the right time.

If all memory is the same,
why do some brands fail more
often than others?

A lot of people think all memory is created equal. Until their system goes down. You've got to be sure that the memory you choose is both compatible and reliable.

That's why so many computing professionals choose Kingston® memory. Kingston is the world's leading manufacturer of memory modules. We make memory for almost every PC, server, workstation, and printer out there. Our engineers customize the design of each module according to the specifications set by the leading

system manufacturers. To ensure dependability, we use exactly the same memory components those manufacturers use. And we test every cell on every chip on every module. (On a 16 megabyte module, that's 128 million cells.) One more thing: Our memory costs up to 50% less than the system manufacturer's brand. To find out how much you can save, just ask your value-added reseller or call Kingston. After all, no one needs a crash course in memory.
